4.1 oscl File List

Here is a list of all files with brief descriptions:

<code>oscl_aostatus.h</code> (Some basic types used with active objects)	659
<code>oscl_assert.h</code> (The file <code>oscl_assert.h</code> provides an OSCL_ASSERT macro to document assumptions and test them during development)	660
<code>oscl_base.h</code> (The file <code>oscl_base.h</code> is the public header that should be included to pick up the platform configuration, basic type definitions, and common macros)	661
<code>oscl_base_alloc.h</code> (A basic allocator that does not rely on other modules)	662
<code>oscl_base_macros.h</code> (This file defines common macros and constants for basic compilation support)	663
<code>oscl_bin_stream.h</code> (Defines a set of binary stream classes which handle portable input / output of binary data regardless of the native byte order)	664
<code>oscl_byte_order.h</code> (This file defines functions providing byte ordering utility (e.g., switching between big and little endian orders))	665
<code>oscl_defalloc.h</code> (The file defines simple default memory allocator classes. These allocators are used by the <code>Oscl_Vector</code> and <code>Oscl_Map</code> class, etc)	666
<code>oscl_dll.h</code> (Defines a DLL entry point)	667
<code>oscl_dns.h</code> (The file <code>oscl_socket.h</code> defines the OSCL DNS APIs)	668
<code>oscl_dns_gethostbyname.h</code>	669
<code>oscl_dns_imp.h</code>	670
<code>oscl_dns_imp_base.h</code>	671
<code>oscl_dns_imp_pv.h</code>	672
<code>oscl_dns_method.h</code>	673
<code>oscl_dns_param.h</code>	674
<code>oscl_dns_request.h</code>	675
<code>oscl_dns_tuneables.h</code>	676
<code>oscl_double_list.h</code> (Internal use types for scheduler)	677
<code>oscl_errno.h</code> (Defines functions to access additional information on errors where supported through an errno or similar service)	678
<code>oscl_error.h</code> (OSCL Error trap and cleanup include file)	679
<code>oscl_error_allocator.h</code> (Defines a memory allocation class used by the oscl error layer)	680
<code>oscl_error_codes.h</code> (Defines basic error and leave codes)	681
<code>oscl_error_imp.h</code> (Internal error implementation support)	682
<code>oscl_error_imp_cppexceptions.h</code> (Implementation File for Leave using C++ exceptions)	683
<code>oscl_error_imp_fatalerror.h</code> (Implementation File for Leave using system fatal error)	684
<code>oscl_error_imp_jumps.h</code> (Implemenation of using Setjmp / Longjmp)	685

<code>oscl_error_trapcleanup.h</code> (OSCL Error trap and cleanup implementation include file)	687
<code>oscl_exception.h</code> (Contains all the exception handling macros and classes)	688
<code>oscl_exclusive_ptr.h</code> (This file defines the <code>OsclExclusivePtr</code> template class. This class is used to avoid any potential memory leaks that may arise while returning from methods in case of error)	689
<code>oscl_file_async_read.h</code>	690
<code>oscl_file_cache.h</code> (The file <code>oscl_file_cache.h</code> defines the class <code>OsclFileCache</code>)	691
<code>oscl_file_dir_utils.h</code> (The file <code>oscl_file_dir_utils.h</code> defines some unix-style directory ops)	692
<code>oscl_file_find.h</code> (The file <code>oscl_file_find.h</code> defines the class <code>Oscl_FileFind</code>)	694
<code>oscl_file_handle.h</code> (The file <code>oscl_file_handle.h</code> defines the class <code>OsclFileHandle</code>)	695
<code>oscl_file_io.h</code> (The file <code>oscl_file_io.h</code> defines the class <code>Oscl_File</code> . This is the public API to the basic file I/O operations)	696
<code>oscl_file_manager.h</code> (File management class)	697
<code>oscl_file_native.h</code> (The file <code>oscl_file_native.h</code> defines the class <code>OsclNativeFile</code> . This is the porting layer for basic file I/O operations)	698
<code>oscl_file_server.h</code> (The file <code>oscl_file_server.h</code> defines the class <code>Oscl_FileServer</code> . This is the porting layer for file server implementations)	699
<code>oscl_file_stats.h</code> (File stats class)	700
<code>oscl_file_types.h</code> (The file <code>oscl_file_types.h</code> defines some constants and types for file I/O implementations. Anything that needs to be shared across implementation modules can go here)	701
<code>oscl_heapbase.h</code> (OSCL Heap Base include file)	702
<code>oscl_init.h</code> (Global oscl initialization)	703
<code>oscl_int64_utils.h</code>	704
<code>oscl_ip_socket.h</code>	705
<code>oscl_linked_list.h</code> (The file <code>oscl_linked_list.h</code> defines the template class <code>Oscl_Linked_List</code> which has a very similar API as the STL Vector class (it basically provides a subset of the STL functionality). Memory allocation is abstracted through the use of an allocator template parameter)	706
<code>oscl_lock_base.h</code> (This file defines an abstract lock class, <code>OsclLockBase</code> , that is used for APIs potentially requiring multi-thread safety. A null-lock implementation, <code>OsclNullLock</code> , is also provided for single-thread configurations (basically a noop for lock/unlock). Also provides the <code>OsclScopedLock</code> class which is template class takes care of freeing the lock when the class goes out of scope)	707
<code>oscl_map.h</code> (The file <code>oscl_map.h</code> defines the template class <code>Oscl_Map</code> which has a very similar API as the STL Map class (it basically provides a subset of the STL functionality). Memory allocation is abstracted through the use of an allocator template parameter)	708
<code>oscl_math.h</code> (Provides math functions)	709
<code>oscl_media_data.h</code> (Defines a container class for media data made up of a collection of memory fragments)	710
<code>oscl_media_status.h</code> (Defines a status values for the <code>MediaData</code> containers)	711
<code>oscl_mem.h</code> (This file contains basic memory definitions for common use across platforms)	712
<code>oscl_mem_align.h</code>	715
<code>oscl_mem_audit.h</code> (This file contains the definition and partial implementation of MM_Audit class)	716
<code>oscl_mem_audit_internals.h</code> (This file contains the internal definitions for the mem audit library)	718
<code>oscl_mem_auto_ptr.h</code> (This file defines the <code>oscl_mem_auto_ptr</code> template class. This class is used to avoid any potential memory leaks that may arise while returning from methods in case of error)	719
<code>oscl_mem_basic_functions.h</code> (This file contains prototypes for the basic memory functions)	720
<code>oscl_mem_inst.h</code> (The file defines default memory instrumentation level)	721
<code>oscl_mem_mempool.h</code> (This file contains the definition of memory pool allocators)	722
<code>oscl_mutex.h</code> (This file provides implementation of mutex)	723
<code>oscl_namestring.h</code> (Name string class include file)	724

<code>oscl_opaque_type.h</code> (The file <code>oscl_opaque_type.h</code> defines pure virtual classes for working with opaque types)	725
<code>oscl_pqueue.h</code> (Implements a priority queue data structure similar to STL)	726
<code>oscl_proctstatus.h</code>	727
<code>oscl_queue.h</code> (The file <code>oscl_queue.h</code> defines the template class <code>Oscl_Queue</code> . It is similar to the <code>STL::queue</code> class, with some differences: - less complete - based on array rather than a deque - some interfaces modeled on <code>oscl_vector</code> , for ease of transition Memory allocation is abstracted through the use of an allocator template parameter)	728
<code>oscl_rand.h</code> (Provides pseudo-random number generation)	729
<code>oscl_refcounter.h</code> (A general purpose reference counter to object lifetimes)	730
<code>oscl_refcounter_memfrag.h</code> (This file provides the definition of reference counted memory fragment, which provides access to a buffer and helps manage its lifetime through the refcount)	731
<code>oscl_registry_access_client.h</code> (Client-side implementation Registry Access implementation)	732
<code>oscl_registry_client.h</code> (Client-side implementation of <code>OsclRegistry</code>)	733
<code>oscl_registry_client_impl.h</code> (Client-side implementation of <code>OsclRegistryInterface</code>)	734
<code>oscl_registry_serv_impl.h</code> (Server-side implementation of <code>OsclRegistry</code> interfaces)	735
<code>oscl_registry_serv_impl_global.h</code>	736
<code>oscl_registry_serv_impl_tls.h</code>	737
<code>oscl_registry_types.h</code> (Common types used in <code>Oscl registry</code> interfaces)	738
<code>oscl_scheduler.h</code>	739
<code>oscl_scheduler_ao.h</code> (<code>Oscl Scheduler</code> user execution object classes)	740
<code>oscl_scheduler_aobase.h</code> (<code>Oscl Scheduler</code> internal active object classes)	741
<code>oscl_scheduler_readyq.h</code> (Ready q types for <code>oscl scheduler</code>)	742
<code>oscl_scheduler_threadcontext.h</code> (Thread context functions needed by <code>oscl scheduler</code>)	743
<code>oscl_scheduler_tuneables.h</code> (Tunable settings for <code>Oscl Scheduler</code>)	744
<code>oscl_scheduler_types.h</code> (Scheduler common types include file)	745
<code>oscl_semaphore.h</code> (This file provides implementation of mutex)	746
<code>oscl_shared_ptr.h</code> (This file defines a template class <code>OsclSharedPtr</code> which is a "smart pointer" to the parameterized type)	747
<code>oscl_singleton.h</code> (This file defines the <code>OsclSingleton</code> class. This class provides a container which used to give access to a set of process-level singleton objects. Each object is indexed by an integer ID, listed below. There can only be one instance of each object per process at a given time)	748
<code>oscl_snprintf.h</code> (Provides a portable implementation of <code>snprintf</code>)	750
<code>oscl_socket.h</code> (The file <code>oscl_socket.h</code> defines the OSCL Socket APIs)	751
<code>oscl_socket_accept.h</code>	752
<code>oscl_socket_bind.h</code>	753
<code>oscl_socket_connect.h</code>	754
<code>oscl_socket_imp.h</code>	755
<code>oscl_socket_imp_base.h</code>	756
<code>oscl_socket_imp_pv.h</code>	757
<code>oscl_socket_listen.h</code>	758
<code>oscl_socket_method.h</code>	759
<code>oscl_socket_recv.h</code>	760
<code>oscl_socket_recv_from.h</code>	761
<code>oscl_socket_request.h</code>	762
<code>oscl_socket_send.h</code>	763
<code>oscl_socket_send_to.h</code>	764
<code>oscl_socket_serv_imp.h</code>	765
<code>oscl_socket_serv_imp_base.h</code>	766
<code>oscl_socket_serv_imp_pv.h</code>	767
<code>oscl_socket_serv_imp_reqlist.h</code>	768
<code>oscl_socket_shutdown.h</code>	769

oscl_socket_stats.h	770
oscl_socket_tunables.h	772
oscl_socket_types.h	774
oscl_stdstring.h (This file provides standard string operations such as strlen, strncpy, etc. ANSI defines undefined behavior when the destination pointer is null for operations such as strncpy, strncat, etc. But, we chose to define one. In such cases, we return the destination as null)	776
oscl_str_ptr_len.h (Defines a data structure for string containment/manipulations where the storage for the string is maintained externally)	778
oscl_string.h (Provides a standardized set of string containers that can be used in place of character arrays)	779
oscl_string_containers.h (Provides a standardized set of string containers that can be used in place of character arrays)	780
oscl_string_rep.h (Contains some internal implementation for string containers)	781
oscl_string_uri.h (Utilities to unescape URIs)	782
oscl_string_utf8.h (Utilities to validate and truncate UTF-8 encoded strings)	783
oscl_string_utils.h (Utilities to parse and convert strings)	784
oscl_string_xml.h (Utilities to escape special characters in XML strings)	785
oscl_tagtree.h (The file oscl_tagtree.h ..)	786
oscl_tcp_socket.h	787
oscl_thread.h	788
oscl_tickcount.h (Defines a data structure for string containment/manipulations where the storage for the string is maintained externally)	790
oscl_time.h (The file oscl_time.h defines two classes NTPTime and TimeValue for getting, manipulating, and formatting time values. The TimeValue class is based on the native system time format while NTPTime is used for the standard Network Time Protocol format)	791
oscl_timer.h	793
oscl_tls.h	794
oscl_tree.h (The file oscl_tree.h defines the template class Oscl_Rb_Tree which has a very similar API as the STL Tree class. It is an implementation of a Red-Black Tree for use by the Oscl_Map class. Memory allocation is abstracted through the use of an allocator template parameter)	795
oscl_types.h (This file contains basic type definitions for common use across platforms)	796
oscl_udp_socket.h	797
oscl_utf8conv.h (Utilities to convert unicode to utf8 and vice versa)	798
oscl_uuid.h (This file defines the OSCL UUID structure used for unique identifiers as well as the short (32-bit) identifiers OsclUid32)	799
oscl_vector.h (The file oscl_vector.h defines the template class Oscl_Vector which has a very similar API as the STL Vector class (it basically provides a subset of the STL functionality). Memory allocation is abstracted through the use of an allocator template parameter)	801
osclconfig.h (This file contains configuration information for the linux platform)	802
osclconfig_ansi_memory.h (This file contains common typedefs based on the ANSI C limits.h header)	804
osclconfig_check.h	805
osclconfig_compiler_warnings.h (This file contains the ability to turn off/on compiler warnings)	806
osclconfig_error.h (This file contains the common typedefs and header files needed to compile osclerror)	807
osclconfig_error_check.h	808
osclconfig_global_new_delete.h	809
osclconfig_global_placement_new.h	810
osclconfig_io.h (This file contains common typedefs based on the ANSI C limits.h header)	811
osclconfig_io_check.h	822
osclconfig_ix86.h (This file contains configuration information for the ix86 processor family)	823

osclconfig_lib.h (This file contains configuration information for the ANSI build)	824
osclconfig_lib_check.h	825
osclconfig_limits_typedefs.h (This file contains common typedefs based on the ANSI C limits.h header)	826
osclconfig_memory.h	827
osclconfig_memory_check.h	828
osclconfig_no_os.h	829
osclconfig_proc.h (This file contains configuration information for the linux platform)	830
osclconfig_proc_check.h	831

6.1.1 Define Documentation

6.1.1.1 `#define OSCL_ASSERT_ALWAYS 0`

macro should be set to 0 or 1. When set to 1, OSCL_ASSERT will be compiled in release mode as well as debug mode.

6.1.1.2 `#define OSCL_BYTE_ORDER_BIG_ENDIAN 0`

macro should be set to 1 if the target platform uses big-endian byte order in memory. Otherwise it should be set to 0.

6.1.1.3 `#define OSCL_BYTE_ORDER_LITTLE_ENDIAN 1`

macro should be set to 1 if the target platform uses little-endian byte order in memory. Otherwise it should be set to 0.

6.1.1.4 `#define OSCL_HAS_ANDROID_SUPPORT 0`

6.1.1.5 `#define OSCL_HAS_BERKELEY_SOCKETS 0`

6.1.1.6 `#define OSCL_HAS_IPHONE_SUPPORT 0`

6.1.1.7 `#define OSCL_HAS_MSWIN_PARTIAL_SUPPORT 0`

6.1.1.8 `#define OSCL_HAS_MSWIN_SUPPORT 0`

6.1.1.9 `#define OSCL_HAS_MSWIN_TIME_FUNCS 0`

6.1.1.10 `#define OSCL_HAS_PRAGMA_PACK 0`

macro should be set to 1 if the compiler supports pragma pack, 0 if it does not.

The file defines default memory instrumentation level.

- file [oscl_opaque_type.h](#)

The file [oscl_opaque_type.h](#) defines pure virtual classes for working with opaque types.

- file [oscl_queue.h](#)

The file [oscl_queue.h](#) defines the template class [Oscl_Queue](#). It is similar to the `STL::queue` class, with some differences: - less complete - based on array rather than a deque - some interfaces modeled on `oscl_vector`, for ease of transition Memory allocation is abstracted through the use of an allocator template parameter.

- file [oscl_refcounter.h](#)

A general purpose reference counter to object lifetimes.

- file [oscl_refcounter_memfrag.h](#)

This file provides the definition of reference counted memory fragment, which provides access to a buffer and helps manage its lifetime through the refcount.

- file [oscl_shared_ptr.h](#)

This file defines a template class [OsclSharedPtr](#) which is a "smart pointer" to the parameterized type.

- file [oscl_stdstring.h](#)

This file provides standard string operations such as `strlen`, `strncpy`, etc. ANSI defines undefined behavior when the destination pointer is null for operations such as `strncpy`, `strncat`, etc. But, we chose to define one. In such cases, we return the destination as null.

Data Structures

- class [_OsclBasicAllocator](#)
- class [LinkedListElement](#)
- class [NTPTime](#)

The [NTPTime](#) class represents a time value as the number of seconds since 0h (UTC) Jan. 1, 1900.

- class [Oscl_Alloc](#)
- class [Oscl_Dealloc](#)
- class [Oscl_DefAlloc](#)
- class [Oscl_DefAllocWithRefCounter](#)
- struct [Oscl_Less](#)
- class [Oscl_Linked_List](#)
- class [Oscl_Linked_List_Base](#)
- class [Oscl_Map](#)
- class [Oscl_MTLinked_List](#)
- class [Oscl_Opaque_Type_Alloc](#)
- class [Oscl_Opaque_Type_Alloc_LL](#)
- class [Oscl_Opaque_Type_Compare](#)
- struct [Oscl_Pair](#)
- class [Oscl_Queue](#)
- class [Oscl_Queue_Base](#)
- class [Oscl_Rb_Tree](#)
- class [Oscl_Rb_Tree_Base](#)
- struct [Oscl_Rb_Tree_Const_Iterator](#)
- struct [Oscl_Rb_Tree_Iterator](#)
- struct [Oscl_Rb_Tree_Node](#)
- struct [Oscl_Rb_Tree_Node_Base](#)
- struct [Oscl_Select1st](#)
- struct [Oscl_Tag](#)
- struct [Oscl_Tag_Base](#)
- class [Oscl_TagTree](#)
- class [Oscl_TAlloc](#)
- class [Oscl_Vector](#)
- class [Oscl_Vector_Base](#)
- class [OsclAllocDestructDealloc](#)
- class [OsclDestructDealloc](#)
- class [OsclExclusiveArrayPtr](#)

The `OsclExclusiveArrayPtr` class is a template class that defines an array pointer like object intended to be assigned an address obtained (directly or or indirectly) by new. When the `OsclExclusiveArrayPtr` expires, its destructor uses delete to free the memory.

- class [OsclExclusivePtr](#)

The `OsclExclusivePtr` class is a template class that defines a pointer like object intended to be assigned an address obtained (directly or or indirectly) by new. When the `OsclExclusivePtr` expires, its destructor uses delete to free the memory.

- class [OsclExclusivePtrA](#)

The `OsclExclusivePtrA` class is a template class that defines any pointer like object intended to be assigned an address obtained (directly or or indirectly) through Alloc. When the `OsclExclusivePtrA` expires, Alloc is used to free the memory.

- class [OsclRefCounterMemFrag](#)
- class [OsclRefCounterMTDA](#)
- class [OsclRefCounterMTSA](#)
- class [OsclRefCounterSA](#)
- class [OsclScopedLock](#)

The OsclScopedLock class is a template class that handles unlocking an abstract class on destruction. This is very useful for ensuring that the lock is released when the OsclScopedLock goes out of scope.

- class [OsclSharedPtr](#)

A parameterized smart pointer class.

- class [OsclTLS](#)
- class [OsclTLSRegistry](#)
- class [TimeValue](#)

The TimeValue class represents a time value in a format native to the system.

Additional osclbase comment

6.2.2 Define Documentation

6.2.2.1 #define ALLOC_AND_CONSTRUCT(n) alloc_and_construct_fl(n,__FILE__,__LINE__)

6.2.2.2 #define ALLOCATE(n) allocate_fl(n,__FILE__,__LINE__)

6.2.2.3 #define NULL (0)

if the NULL macro isn't already defined, then define it as zero.

6.2.2.4 #define NULL_TERM_CHAR '\0'

The NULL_TERM_CHAR is used to terminate c-style strings.

6.2.2.5 #define OSCL_ABS(a) ((a) > (0) ? (a) : -(a))

6.2.2.6 #define OSCL_ASSERT(_expr) ((_expr)?((void)0):OSCLAssert#_expr,__FILE__,__LINE__))

6.2.2.7 #define OSCL_COND_EXPORT_REF

6.2.2.8 #define OSCL_COND_IMPORT_REF

6.2.2.9 #define OSCL_CONST_CAST(type, exp) ((type)(exp))

Type casting macros.

Parameters:

type Destination type of cast

exp Expression to cast

6.2.2.10 #define OSCL_DISABLE_WARNING_RETURN_TYPE_NOT_UDT

6.2.2.11 #define OSCL_DISABLE_WARNING_TRUNCATE_DEBUG_MESSAGE

6.2.2.12 #define OSCL_DLL_ENTRY_POINT() void oscl_dll_entry_point() {}

DLL entry/exit point.

Allows you to define custom operations at the entry and exit of the DLL. Place this macro within one source file for each DLL.

Functions with the custom commands for the DLL entry and exit point must also be defined. The entry point custom function is LocalDllEntry(), and the exit point custom function is LocalDllExit().

These functions will be called as a result of executing this macro.

Usage :

```
LocalDliEntry() { custom operations... }  
LocalDliExit() { custom operations... }  
OSCL_DLL_ENTRY_POINT()
```

6.2.2.13 #define OSCL_DLL_ENTRY_POINT_DEFAULT()

Default DLL entry/exit point function.

The body of the DLL entry point is given. The macro only needs to be declared within the source file.

Usage :

```
OSCL_DLL_ENTRY_POINT_DEFAULT()
```

6.2.2.14 #define OSCL_DYNAMIC_CAST(type, exp) ((type)(exp))

6.2.2.26 #define OSCL_UNSIGNED_CONST(x) x

6.2.2.27 #define OSCL_UNUSED_ARG(vbl) (void)(vbl)

The following two macros are used to avoid compiler warnings.

OSCL_UNUSED_ARG(vbl) is used to "reference" an otherwise unused parameter or variable, often one which is used only in an OSCL_ASSERT and thus unreferenced in release mode **OSCL_UNUSED_RETURN(val)** provides a "return" of a value, in places which will not actually be executed, such as after an OSCL_LEAVE or Thread::exit or abort. The value needs to be of an appropriate type for the current

function, though zero will usually suffice. Note that OSCL_UNUSED_RETURN will not be necessary for 'void' functions, as there is no requirement for a value-return operation.

6.2.2.28 #define OSCL_UNUSED_RETURN(value) return value

6.2.5 Function Documentation

6.2.5.1 `OSCL_COND_IMPORT_REF void _OSCL_Abort()`

This function terminates the current process abnormally.

6.2.5.2 `void big_endian_to_host (char * data, unsigned int size)`

Convert big endian to host format.

This function takes a buffer of data which is assumed to be in big endian order and rearranges it to the native order of the machine running the code. If the machine is a big endian machine, nothing is done.

Parameters:

data A pointer to the input/output buffer

size The number of bytes in the buffer.

6.2.5.3 `template<class TheClass> void OsclSharedPtr< TheClass >::Bind (TheClass * ptr, OsclRefCounter * in_refcnt) [inline, inherited]`

Use this function to bind an existing OsclSharedPtr to a new (unwrapped) object.

6.2.5.4 `template<class TheClass> void OsclSharedPtr< TheClass >::Bind (const OsclSharedPtr< TheClass > & inHandle) [inline, inherited]`

Use this function to bind an existing OsclSharedPtr to a already-wrapped object.

6.2.5.5 void host_to_big_endian (char * *data*, unsigned int *size*)

Convert host to big endian format.

This function takes a buffer of data which is assumed to be in native host order and rearranges it to big endian format. If the machine is a big endian machine, nothing is done.

Parameters:

- data* A pointer to the input/output buffer
- size* The number of bytes in the buffer.

6.2.5.6 void host_to_little_endian (char * *data*, unsigned int *size*)

Convert host to little endian format.

This function takes a buffer of data which is assumed to be in the host's native order and rearranges it to the little endian format. If the machine is a little endian machine, nothing is done.

Parameters:

- data* A pointer to the input/output buffer
- size* The number of bytes in the buffer.

6.2.5.7 OSCL_IMPORT_REF void ISO8601ToRFC822 ([ISO8601timeStrBuf iso8601_buffer](#), [CtimeStrBuf ctime_buffer](#))

6.2.5.8 void little_endian_to_host (char * *data*, uint32 *size*)

Convert little endian to host format.

This function takes a buffer of data which is assumed to be in little endian order and rearranges it to the native order of the machine running the code. If the machine is a little endian machine, nothing is done.

Parameters:

- data* A pointer to the input/output buffer
- size* The number of bytes in the buffer.

- 6.2.5.9 OSCL_COND_IMPORT_REF TimeValue operator+ (const int32 *aSeconds*, const TimeValue & *b*)**
- 6.2.5.10 OSCL_COND_IMPORT_REF TimeValue operator+ (const TimeValue & *a*, const int32 *bSeconds*)**

- 6.2.5.14 template<class TheClass> bool OsclSharedPtr<TheClass>::operator== (const OsclSharedPtr<TheClass> & *b*) const [inline, inherited]**

Test for equality to see if two PVHandles wrap the same object.

- 6.2.5.15 OSCL_IMPORT_REF void OSCL_Assert (const char * *expr*, const char * *filename*, int *line_number*)**

OSCL_ASSERT macro evaluates an expression and when the result is false, prints a diagnostic message and aborts the program.

Parameters:

- expr* is the expression to be evaluated
- filename* is the name of the current source file
- line_number* is the line number in the current source file

- 6.2.5.16 OSCL_IMPORT_REF int32 oscl_CIstrcmp (const oscl_wchar * *str1*, const oscl_wchar * *str2*)**

Case in-sensitive string comparision.

Parameters:

- str1* string to compare
- str2* string to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

- 6.2.5.17 OSCL_IMPORT_REF int32 oscl_CIstrcmp (const char * *str1*, const char * *str2*)**

Case in-sensitive string comparision.

Parameters:

- str1* string to compare

str2 string to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.18 OSCL_IMPORT_REF int32 oscl_Clstrncmp (const oscl_wchar * *str1*, const oscl_wchar * *str2*, uint32 *count*)

Lexicographically compares(case in-sensitive), at most, the first count characters in str1 and str2 and returns a value indicating the relationship between the substrings.

Parameters:

str1 string to compare

str2 string to compare

count Number of characters to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.19 OSCL_IMPORT_REF int32 oscl_Clstrncmp (const char * *str1*, const char * *str2*, uint32 *count*)

Lexicographically compares(case in-sensitive), at most, the first count characters in str1 and str2 and returns a value indicating the relationship between the substrings.

Parameters:

str1 string to compare

str2 string to compare

count Number of characters to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.20 OSCL_IMPORT_REF bool oscl_isLetter (const char *car*)

check if supplied parameter is an alphabet (ASCII only).

Parameters:

car

Returns:

1 if car is an alphabet 0 if car is not an alphabet.

6.2.5.21 OSCL_IMPORT_REF oscl_wchar* oscl_streat (oscl_wchar * dest, const oscl_wchar * src)

Appends up to count characters from string src to string dest, and then appends a terminating null character. The initial character of src overwrites the null character at the end of dest. Subsequent characters in src are appended to dest until either the end of src is reached or count characters have been copied. If copying takes place between objects that overlap, the behavior is undefined.

Parameters:

dest null terminated destination string

src source string

count number of characters to append.

Returns:

dest

6.2.5.22 OSCL_IMPORT_REF char* oscl_streat (char * dest, const char * src)

Appends string src to string dest, and then appends a terminating null character. The initial character of src overwrites the null character at the end of dest. Subsequent characters in src are appended to dest until the end of src is reached. If copying takes place between objects that overlap, the behavior is undefined.

Parameters:

dest null terminated destination string

src source string

Returns:

dest

6.2.5.23 OSCL_IMPORT_REF oscl_wchar* oscl_strchr (oscl_wchar * str, int32 c)**6.2.5.24 OSCL_IMPORT_REF const oscl_wchar* oscl_strchr (const oscl_wchar * str, int32 c)**

Finds the first occurrence of c in string, or it returns NULL if c is not found. The null-terminating character is included in the search.

Parameters:

str null terminated source string

c character to search for

Returns:**6.2.5.25 OSCL_IMPORT_REF char* oscl_strchr (char * str, int32 c)****6.2.5.26 OSCL_IMPORT_REF const char* oscl_strchr (const char * str, int32 c)**

Finds the first occurrence of c in string, or it returns NULL if c is not found. The null-terminating character is included in the search.

Parameters:

str null terminated source string

c character to search for

Returns:**6.2.5.27 OSCL_IMPORT_REF int32 oscl_strcmp (const oscl_wchar * str1, const oscl_wchar * str2)**

Lexicographically compares two NULL terminated strings, str1 and str2, and returns a value indicating the relationship between them.

Parameters:

str1 String to compare

str2 String to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.28 OSCL_IMPORT_REF int32 oscl_strcmp (const char * str1, const char * str2)

Lexicographically compares two NULL terminated strings, str1 and str2, and returns a value indicating the relationship between them.

Parameters:

str1 String to compare

str2 String to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.29 OSCL_IMPORT_REF uint32 oscl_strlen (const oscl_wchar * str)

Gets the length of a wide char string

Parameters:

str NULL terminated string.

Returns:

Returns the number of characters in string, excluding the terminal NULL.

6.2.5.30 OSCL_IMPORT_REF uint32 oscl_strlen (const char * str)

Gets the length of a string

Parameters:

str NULL terminated string.

Returns:

Returns the number of characters in string, excluding the terminal NULL.

6.2.5.31 OSCL_IMPORT_REF oscl_wchar* oscl_strncat (oscl_wchar * dest, const oscl_wchar * src, uint32 count)

Appends up to count characters from string src to string dest, and then appends a terminating null character. The initial character of src overwrites the null character at the end of dest. Subsequent characters in src are appended to dest until either the end of src is reached or count characters have been copied. If copying takes place between objects that overlap, the behavior is undefined.

Parameters:

dest null terminated destination string

src source string

count number of characters to append.

Returns:

dest

6.2.5.32 OSCL_IMPORT_REF char* oscl_strncat (char * dest, const char * src, uint32 count)

Appends up to count characters from string src to string dest, and then appends a terminating null character. The initial character of src overwrites the null character at the end of dest. Subsequent characters in src are appended to dest until either the end of src is reached or count characters have been copied. If copying takes place between objects that overlap, the behavior is undefined.

Parameters:

dest null terminated destination string

src source string

count number of characters to append.

Returns:

dest

6.2.5.33 OSCL_IMPORT_REF int32 oscl_strcmp (const oscl_wchar * str1, const oscl_wchar * str2, uint32 count)

Lexicographically compares, at most, the first count characters in str1 and str2 and returns a value indicating the relationship between the substrings.

Parameters:

str1 String to compare

str2 String to compare

count Number of characters to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.34 OSCL_IMPORT_REF int32 oscl_strncmp (const char * str1, const char * str2, uint32 count)

Lexicographically compares, at most, the first count characters in str1 and str2 and returns a value indicating the relationship between the substrings.

Parameters:

- str1* String to compare
- str2* String to compare
- count* Number of characters to compare

Returns:

Negative if str1 < str2 Positive if str1 > str2 Zero if equal

6.2.5.35 OSCL_IMPORT_REF oscl_wchar* oscl_strncpy (oscl_wchar * dest, const oscl_wchar * src, uint32 count)

Copies the chars of one string to another.

Copies the initial count characters of src to dest and returns dest. If count is less than or equal to the length of src, a null character is not appended automatically to the copied string. If count is greater than the length of src, the destination string is padded with null characters up to length count. The behavior of strncpy is undefined if the source and destination strings overlap.

Parameters:

- dest* Destination string
- src* NULL terminated source string
- count* Number of chars to copy

Returns:

Returns dest.

6.2.5.36 OSCL_IMPORT_REF char* oscl_strncpy (char * dest, const char * src, uint32 count)

Copies the chars of one string to another.

Copies the initial count characters of src to dest and returns dest. If count is less than or equal to the length of src, a null character is not appended automatically to the copied string. If count is greater than the length of src, the destination string is padded with null characters up to length count. The behavior of strncpy is undefined if the source and destination strings overlap.

Parameters:

- dest* Destination string
- src* NULL terminated source string
- count* Number of chars to copy

Returns:

Returns dest.

6.2.5.37 OSCL_IMPORT_REF oscl_wchar* oscl_strrchr (oscl_wchar * str, int32 c)

6.2.5.38 OSCL_IMPORT_REF const oscl_wchar* oscl_strrchr (const oscl_wchar * str, int32 c)

6.2.5.39 OSCL_IMPORT_REF char* oscl_strrchr (char * str, int32 c)

6.2.5.40 OSCL_IMPORT_REF const char* oscl_strrchr (const char * str, int32 c)

Finds the last occurrence of c in string, or it returns NULL if c is not found. The null-terminating character is included in the search.

Parameters:

str null terminated source string

c character to search for

Returns:

6.2.5.41 OSCL_IMPORT_REF oscl_wchar* oscl_strset (oscl_wchar * dest, oscl_wchar val, uint32 count)

Sets the characters of a string to a specified character

Parameters:

dest buffer to modify

val character to set

count number of chars to set

Returns:

the value of dest

6.2.5.42 OSCL_IMPORT_REF char* oscl_strset (char * dest, char val, uint32 count)

Sets the characters of a string to a specified character

Parameters:

dest buffer to modify

val character to set

count number of chars to set

Returns:

the value of dest

6.2.5.43 OSCL_IMPORT_REF oscl_wchar* oscl_strstr (oscl_wchar * str1, const oscl_wchar * str2)

6.2.5.44 OSCL_IMPORT_REF const oscl_wchar* oscl_strstr (const oscl_wchar * str1, const oscl_wchar * str2)

find the occurrence of sub-string in a string.

Parameters:

str1 string.

str2 sub-string

Returns:

pointer to the begining of sub-string.

6.2.5.45 OSCL_IMPORT_REF char* oscl strstr (char * str1, const char * str2)**6.2.5.46 OSCL_IMPORT_REF const char* oscl strstr (const char * str1, const char * str2)**

find the occurrence of sub-string in a string.

Parameters:

str1 string.

str2 sub-string

Returns:

pointer to the begining of sub-string.

6.2.5.47 OSCL_IMPORT_REF oscl_wchar oscl_tolower (const oscl_wchar car)

convert upper case ASCII character to lower case. behaviour of this function for non-ASCII characters is not defined.

Parameters:

car upper case character.

Returns:

lower case character.

6.2.5.48 OSCL_IMPORT_REF char oscl_tolower (const char car)

convert upper case ASCII character to lower case. behaviour of this function for non-ASCII characters is not defined.

Parameters:

car upper case character.

Returns:

lower case character.

6.2.5.49 OSCL_IMPORT_REF void PV8601ToRFC822 (PV8601timeStrBuf** *pv8601_buffer*,

Cleanup OsclBase functionality OsclBase should be cleaned once OsclBase functions are no longer needed

6.2.5.51 void PVosclBase_Init ()

Initializes OsclBase functionality. OsclBase must be initialized before any OsclBase functionality can be used.

Exceptions:

leaves if out-of-memory

6.3.1 Define Documentation

6.3.1.1 #define _OSCL_CLEANUP_BASE_CLASS(T) this → T::~T()

This macro is used to cleanup the base class in a derived-class constructor just before a leave occurs.

Parameters:

T: base class name.

6.3.1.2 #define _OSCL_TRAP_NEW(exp, freeFunc, T_ptr, T, params)

Value:

```
{
    int32 __err; \
    OsclAny* __ptr=exp; \
    OSCL_TRY(__err,T_ptr=new(__ptr) T params); \
    if(__err){ \
        freeFunc(__ptr); \
        T_ptr=NULL; \
        OsclError::Leave(__err); \
    } \
}
```

Internal-use macro to catch leaves in constructors. If the constructor leaves, this will free the memory before allowing the leave to propagate to the next level. It is the constructor's responsibility to cleanup any memory in the partially constructed object before leaving. This cleanup may include cleaning up the base class using the OSCL_CLEANUP_BASE_CLASS macro.

Parameters:

exp: expression to allocate memory.

Tptr:variable to hold result.

T: type

params: constructor arg list

freeFunc: delete or free function.

Value:

```
{\
  ptr->~T();\
  T_allocator.deallocate(ptr);\
}
```

Deletes the object of type T using the given allocator

Parameters:

T_allocator allocator for objects of type T

T type of object to delete

ptr pointer to previously created object

Exceptions:

none , unless thrown by the given allocator

**6.3.1.25 #define OSCL_ALLOC_NEW(T_allocator, T, params) new(T_allocator.allocate(1)) T
params**

Creates an object of type T using the given allocator to acquire the memory needed.

Parameters:

T_allocator allocator for objects of type T, must be an [Oscl_TAlloc<T, Allocator>](#), where Allocator is an [Oscl_DefAlloc](#)

T type of object to create

params object initialization parameters

Returns:

pointer to created object

Exceptions:

none , unless thrown by the given allocator

6.3.1.26 #define OSCL_ARRAY_DELETE(ptr) delete [] ptr

Oscl array delete operator..

Parameters:

ptr pointer to memory block previously allocated with OSCL_ARRAY_NEW

Returns:

void

6.3.1.27 #define OSCL_ARRAY_NEW(T, count) new T[count]

Oscl array "new" operator. This uses the global memory audit object.

Parameters:

T data type for 'new' operation

count number of elements to create

Returns:

pointer to the newly created object array of type T

Exceptions:

may leave with code = bad alloc

6.3.1.28 #define OSCL_AUDIT_ARRAY_NEW(auditCB, T, count)
`new(_oscl_audit_new(sizeof(T)*(count),auditCB)) T`

Oscl array "new" operator. This uses the input memory audit object.

Parameters:

auditCB input memory management audit object
T data type for 'new' operation
count number of elements to create

Returns:

pointer to the newly created object array of type T

Exceptions:

may leave with code = bad alloc

6.3.1.29 #define OSCL_AUDIT_CALLOC(auditCB, num, size) _oscl_audit_calloc(num,size, auditCB)

Allocates a memory block using the specified audit object. The block is initialized to zero.

Parameters:

auditCB input memory management audit object
num number of elements
size number of bytes to allocate for each element

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.30 #define OSCL_AUDIT_MALLOC(auditCB, count) _oscl_audit_malloc(count, auditCB)

Allocates a memory block using the given audit object.

Parameters:

auditCB input memory management audit object
count number of bytes to allocate

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.31 #define OSCL_AUDIT_NEW(auditCB, T, params) new(_oscl_audit_new(sizeof(T),audit-CB)) T params

Oscl "new" operator. This uses the specified memory audit object.

Parameters:

auditCB input memory management audit object
T data type for 'new' operation
params object initialization parameters

Returns:

pointer to the newly created object of type *T*

Exceptions:

may leave with code = bad alloc

**6.3.1.32 #define OSCL_AUDIT_REALLOC(auditCB, ptr, new_size)
_oscl_audit_realloc(ptr,new_size,auditCB)**

Re-Allocates a memory block using the specified audit object.

Parameters:

auditCB input memory management audit object
ptr original memory block
new_size New size of the block

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.33 #define oscl_calloc(a, b) OSCL_CALLOC(a,b)**6.3.1.34 #define OSCL_CALLOC(num, size) _oscl_default_audit_calloc(num,size)**

Allocates a memory block using the memory management's global audit object. The block is initialized to zero.

Parameters:

num number of elements
size number of bytes to allocate for each element

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.35 #define OSCL_CLEANUP_BASE_CLASS(T) _OSCL_CLEANUP_BASE_CLASS(T)

Cleans up the base class of a partially-constructed derived class. This macro will call the destructor if necessary, based on the error-handling implementation.

Parameters:

T: name of the base class.

6.3.1.36 #define OSCL_DEFAULT_FREE(x) OSCL_FREE(x)

Another back-compatibility definition.

6.3.1.37 #define OSCL_DEFAULT_MALLOC(x) OSCL_MALLOC(x)

Another back-compatibility definition.

6.3.1.38 #define OSCL_DELETE(ptr)**Value:**

```
{ \
    if(ptr){delete(ptr);} \
}
```

Oscl "delete" operator.

Parameters:

ptr pointer to memory block previously allocated with OSCL_NEW

Returns:

void

6.3.1.39 #define OSCL_DISABLE_WARNING_RETURN_TYPE_NOT_UDT**6.3.1.40 #define OSCL_DISABLE_WARNING_TRUNCATE_DEBUG_MESSAGE**

Previously this was in oscl_mem_imp.h

6.3.1.41 #define oscl_free(x) OSCL_FREE(x)**6.3.1.42 #define OSCL_FREE(ptr) _oscl_audit_free(ptr)**

Deallocates or frees a memory block.

Parameters:

ptr pointer to previously allocated memory block using the given audit object

6.3.1.43 #define OSCL_HAS_GLOBAL_NEW_DELETE 1

6.3.1.44 #define oscl_malloc(a) OSCL_MALLOC(a)

6.3.1.45 #define OSCL_MALLOC(count) _oscl_default_audit_malloc(count)

Allocates a memory block using the memory management's global audit object.

Parameters:

count number of bytes to allocate

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.46 #define OSCL_NEW(T, params) new T params

Oscl "new" operator. This uses the global memory audit object.

Parameters:

T data type for 'new' operation

params object initialization parameters

Returns:

pointer to the newly created object of type T

Exceptions:

may leave with code = bad alloc

6.3.1.47 #define OSCL_PLACEMENT_NEW(ptr, constructor) new(ptr) constructor

6.3.1.48 #define oscl_realloc(a, b) OSCL_REALLOC(a,b)

6.3.1.49 #define OSCL_REALLOC(ptr, new_size) _oscl_default_audit_realloc(ptr,new_size)

Re-Allocates a memory block using the memory management's global audit object.

Parameters:

ptr original memory block

new_size New size of the block

Returns:

a void pointer to the allocated space, or NULL if there is insufficient memory available.

Exceptions:

none

6.3.1.50 #define OSCL_TRAP_ALLOC_NEW(T_ptr, T_allocator, T, params)
_OSCL_TRAP_NEW(T_allocator.allocate(1),T_allocator.deallocate,T_ptr,T,params)

Creates an object of type T using the given allocator to acquire the memory needed. This macro is similar to OSCL_ALLOC_NEW except that it handles constructors that leave. If the constructor leaves, the destructor will be called, and allocated memory will be freed before allowing the leave to propagate to the next level.

Parameters:

T_ptr variable to hold return value— pointer to new object of type T.

T_allocator allocator for objects of type T, must be an [Oscl_TAlloc<T, Allocator>](#), where Allocator is an [Oscl_DefAlloc](#)

T type of object to create

params object initialization parameters

Returns:

pointer to created object

Exceptions:

none , unless thrown by the given allocator

**6.3.1.51 #define OSCL_TRAP_AUDIT_NEW(T_ptr, auditCB, T, params) _OSCL_TRAP_-
 NEW(_oscl_audit_new(sizeof(T),auditCB),_oscl_audit_free,T_ptr,T,params)**

Oscl "new" operator. This uses the specified memory audit object. This macro is similar to OSCL_AUDIT_NEW except that it will handle constructors that leave. If the constructor leaves, the destructor will be called, and allocated memory will be freed before allowing the leave to propagate to the next level.

Parameters:

T_ptr variable to hold return value— pointer to new object of type T.

auditCB input memory management audit object

T data type for 'new' operation

params object initialization parameters

Returns:

pointer to the newly created object of type T

Exceptions:

may leave with code = bad alloc

**6.3.1.52 #define OSCL_TRAP_NEW(T_ptr, T, params) _OSCL_TRAP_NEW(_oscl_default_-
 audit_new(sizeof(T)),_oscl_audit_free,T_ptr,T,params)**

Oscl "new" operator. This uses the global memory audit object. This operator is similar to OSCL_NEW except that it will handle constructors that leave. If the constructor leaves, the destructor will be called, and allocated memory will be freed before allowing the leave to propagate to the next level.

Parameters:

T_ptr variable to hold return value— pointer to new object of type T.

T data type for 'new' operation

params object initialization parameters

Returns:

pointer to the newly created object of type T

Exceptions:

may leave with code = bad alloc

6.3.3.20 OSCL_COND_IMPORT_REF uint oscl_mem_aligned_size (uint *size*)

Get memory-aligned size of an object.

Parameters:

size size of object

Returns:

memory-aligned size

6.3.3.21 OSCL_COND_IMPORT_REF int oscl_memcmp (const void * buf1, const void * buf2, uint32 count)

Compare characters in two buffers

Parameters:

buf1 first buffer

buf2 second buffer

count number of bytes to compare

Returns:

<0 buf1 less than buf2 0 buf1 equal to buf2 >0 buf1 greater than buf2

6.3.3.22 OSCL_COND_IMPORT_REF void* oscl_memcpy (void * dest, const void * src, uint32 count)

Copies characters between buffers The oscl_memcpy function copies count bytes of src to dest. If the source and destination overlap, this function does not ensure that the original source bytes in the overlapping region are copied before being overwritten. Use oscl_memmove to handle overlapping regions

Parameters:

dest new buffer

src buffer to copy

count number of bytes to copy

Returns:

the value of dest

6.3.3.23 OSCL_COND_IMPORT_REF void* oscl_memmove (void * dest, const void * src, uint32 count)

Moves chars from one buffer to another The memmove function copies count bytes of characters from src to dest. If some regions of the source area and the destination overlap, memmove ensures that the original source bytes in the overlapping region are copied before being overwritten.

Parameters:

dest new buffer

src buffer to copy

count number of bytes to copy

Returns:

the value of dest

6.3.3.24 OSCL_COND_IMPORT_REF void* oscl_memmove32 (void * dest, const void * src, uint32 count)

Same functionality as oscl_memmove, yet optimized for memory aligned on 32-bit boundary

Parameters:

dest new buffer
src buffer to copy
count number of bytes to copy

Returns:

the value of dest

6.3.3.25 OSCL_COND_IMPORT_REF void* oscl_memset (void * dest, uint8 val, uint32 count)

Sets the bytes of a buffer to a specified character

Parameters:

dest buffer to modify
val character to set
count number of bytes to set

Returns:

the value of dest

6.3.3.26 OSCL_IMPORT_REF void OsclMemInit ([OsclAuditCB](#) & auditCB)

Initialize an [OsclAuditCB](#) object. Sets the stats node pointer to null, and sets the audit pointer to the global audit object.

Parameters:

auditCB memory management audit object

6.4.2.4 typedef OsclAny* OsclComponentFactory

OsclComponentFactory is an opaque pointer.

6.4.2.5 typedef StrCSumPtrLen StrCSumPtrLen

same as `StrPtrLen`, but includes checksum field and method to speed up querying

6.4.2.6 typedef struct StrPtrLen StrPtrLen

This data structure encapsulates a set of functions used to perform.

standard string operations. It should be used for null-terminated constant (non-modifiable) strings of char type.

6.4.2.7 `typedef struct WStrPtrLen WStrPtrLen`

This data structure encapsulates a set of functions used to perform standard string operations. It should be used for null-terminated constant strings (non-modifiable) of wchar type.

6.4.3 Enumeration Type Documentation

6.4.3.1 `enum TOSCL_StringOp`

6.4.4.40 template<class Alloc> OSCL_HeapString< Alloc >::OSCL_HeapString (const OSCL_HeapString< Alloc > & src) [inherited]

Creates a heap string that contains a copy of the input string.

Parameters:

src: input string.

6.4.4.41 template<class Alloc> OSCL_HeapString< Alloc >::OSCL_HeapString (const chartype * buf, uint32 length) [inherited]

Creates a heap string that contains a copy of the input string or character array.

Parameters:

src: character array, not necessarily null-terminated.

length: number of characters to copy.

6.4.4.42 template<class Alloc> OSCL_HeapString< Alloc >::OSCL_HeapString (const chartype * cstr) [inherited]

Creates a heap string that contains a copy of the input string.

Parameters:

cp: null-terminated string.

6.4.4.43 template<class Alloc> OSCL_HeapString< Alloc >::OSCL_HeapString () [inherited]

The default constructor creates an empty string.

6.4.4.44 OSCL_COND_IMPORT_REF double oscl_log (double value)

Calculates the natural log of a number

Parameters:

Creates an OSCL_StackString with a copy of the input string. The string may be truncated to fit the available storage.

Parameters:

src: input string.

6.4.4.53 template<uint32 MaxBufSize> OSCL_StackString< MaxBufSize >::OSCL_StackString (const *chartype* * *buf*, uint32 *length*) [inherited]

Creates an OSCL_StackString with a copy of the input string. The string may be truncated to fit the available storage.

Parameters:

src: a character array, not necessarily null-terminated.

length: the number of characters to copy.

**6.4.4.54 template<uint32 MaxBufSize> OSCL_StackString<MaxBufSize>::OSCL_StackString
(const chartype * *cstr*) [inherited]**

Creates an OSCL_StackString with a copy of the input string. The string may be truncated to fit the available storage.

Parameters:

cp: a null-terminated string.

**6.4.4.55 template<uint32 MaxBufSize> OSCL_StackString<MaxBufSize>::OSCL_StackString
() [inherited]**

Creates an OSCL_StackString initialized with an empty string.

**6.4.4.56 OSCL_IMPORT_REF int32 oscl_str_escape_xml (const char * *str_buf_in*, char *
str_buf_out, uint32 *max_out_buf_bytes*, uint32 *max_bytes* = 0, uint32 * *num_bytes_written*
= NULL)**

Escape any of the following special characters in the string Special ASCII characters: &, <, >, ', ".

The function scans the string and replaces each special character with its corresponding escape sequence. It stops at the first NULL character, the max_byte value.

Parameters:

str_buf_in Ptr to an input string

str_buf_out Ptr to an output buffer which stores the modified string

max_out_buf_bytes The size of str_buf_out.

max_bytes The maximum number of bytes to read (a zero value means read to the first NULL character). It is the length of str_buf_in.

num_bytes_written Number of bytes written in the output buffer, str_buf_out

Returns:

It returns the number of bytes in the str_buf_outring if succeeded. It returns negative number if failed, and its absolute value indicates the total number bytes written to the output buffer, str_buf_out, if str_buf_out != null.

**6.4.4.57 OSCL_IMPORT_REF bool oscl_str_is_valid_utf8 (const uint8 * *str_buf*, uint32 &
num_valid_characters, uint32 *max_bytes* = 0, uint32 *max_char_2_valid* = 0, uint32 *
num_byte_4_char = NULL)**

Check if the input string contains any illegal UTF-8 character. The function scans the string and validate that each character is a valid utf-8. It stops at the first NULL character, invalid character or the max_byte value. The string is valid if and only if every character is a valid utf-8 character and the scanning stopped on a character boundary.

Parameters:

str_buf Ptr to an input string, which may not terminate with null, to be checked

num_valid_chars This is an output parameter which is the number of valid utf-8 characters actually read.

max_bytes The maximum number of bytes to read (a zero value means read to the first NULL character).

max_char_2_valid This is an input parameter. Specify the number of utf-8 characters the caller wants to validate.

num_byte_4_char This is an output parameter. The number of bytes used by the max_char characters

Returns:

True if the string is valid and false otherwise.

6.4.4.58 OSCL_IMPORT_REF bool oscl_str_need_escape_xml (const char * str_buf, uint32 & num_escape_bytes, uint32 max_bytes = 0)

Check if the input string contains any special ASCII character like &, <, >, ', ". The function scans the string and check if each character is a special character. It stops at the first NULL character (if max_bytes = 0), or the max_byte value.

Parameters:

str_buf Ptr to an input string, which may not terminate with null, to be checked

num_escape_bytes This is an output parameter which is the number of bytes needed to hold the result string. Value 0 indicates that there is no special character found. If max_bytes = 0, the return value does not include the null character.

max_bytes The maximum number of bytes to read (a zero value means read to the first NULL character).

Returns:

True if the function succeeds, and num_escape_bytes = 0 means that no special character is found, num_escape_bytes >0 means the number of bytes of the result string. False if there is any error occurred.

6.4.4.59 OSCL_IMPORT_REF int32 oscl_str_truncate_utf8 (uint8 * str_buf, uint32 max_char, uint32 max_bytes = 0)

Truncates the UTF-8 string upto the required size.

The function will modify the str_buf so that it contains AT MOST len valid utf-8 characters. If a NULL character is found before reading len utf-8 characters, then the function does not modify the string and simply returns the number of characters. If an invalid character is found, then it will insert a NULL character after the last valid character and return the length. Otherwise, it will insert a NULL character after len valid utf-8 characters and return the length.

Parameters:

str_buf Ptr to an input string which may not terminate with null

max_char The max number of the UTF-8 CHARACTERS

max_bytes The maximum number of bytes to read (a zero value means read to the first NULL character).

Returns:

It returns the length of the truncated string in utf-8 characters.

6.4.4.60 OSCL_IMPORT_REF bool oscl_str_unescape_uri (const OSCL_String & *oscl_str_in*, OSCL_String & *oscl_str_out*, uint32 & *out_buf_len*)

unescape any of the special escape sequence in the uri string

The function scans the string and replaces each escape sequence with its corresponding character. It stops at the first null character, or the max_byte value. It returns false if the string contains any illegal escape sequence or the output buffer is not big enough. The out_buf_len value indicates the needed buffer length or the index of the byte that causes the error respectively.

Parameters:

oscl_str_in Ptr to an input OSCL_String

oscl_str_out Ptr to an output OSCL_String which stores the modified string

out_buf_len The length of the result string (not including the null character)

Returns:

It returns true if succeeds, otherwise false.

6.4.4.61 OSCL_IMPORT_REF bool oscl_str_unescape_uri (const char * *str_buf_in*, char * *str_buf_out*, uint32 *max_out_buf_bytes*, uint32 *max_bytes*, uint32 & *out_buf_len*)

unescape any of the special escape sequence in the uri string

The function scans the string and replaces each escape sequence with its corresponding character. It stops at the first null character, or the max_byte value. It returns false if the string contains any illegal escape sequence or the output buffer is not big enough. The out_buf_len value indicates the needed buffer length or the index of the byte that causes the error respectively.

Parameters:

str_buf_in Ptr to an input string

str_buf_out Ptr to an output buffer which stores the modified string

max_out_buf_bytes The size of str_buf_out.

max_bytes The maximum number of bytes to read. It is the length of str_buf_in.

out_buf_len The length of the result string (not including the null character)

Returns:

It returns true if succeeds, otherwise false.

6.4.4.62 OSCL_COND_IMPORT_REF double oscl_tan (double *value*)

Calculates the tangential of a number

Parameters:

value source value

6.4.4.63 OSCL_IMPORT_REF int32 oscl_UnicodeToUTF8 (const oscl_wchar * *input*, int32 *inLength*, char * *output*, int32 *outLength*)

Convert Unicode string to UTF8 byte sequence.

The function converts Unicode string to UTF8 byte sequence. The length of input Unicode string is specified. It stops at two conditions: (A) Whole input Unicode string is successfully converted. (B) Destination buferr is not enough for output. In case of (A), it adds a terminated '\0' at the end of the output UTF8 byte sequence, and returns length of the output UTF8 byte sequence (without counting terminated '\0'). In case of (B), it converts as much as possible to the output buffer and adds a terminated '\0' at the end of the output UTF8 byte sequence "(no '\0' added if outLength is less than or equal to 0, return 0)", and returns 0.

Parameters:

input Ptr to an input Unicode string. '\0' termination is not necessary.

inLength The length of the input Unicode string, without counting terminated '\0' (if any).

output Ptr to an output buffer which output UTF8 byte sequence is written in.

outLength The size of output buffer, also the maximum number of char could be written in.

Returns:

length of output (excludes '\0') : completely converts all input string and appends '\0' to output; 0 : insufficient buffer or error in conversion

6.4.4.64 OSCL_IMPORT_REF int32 oscl_UTF8ToUnicode (const char * *input*, int32 *inLength*, oscl_wchar * *output*, int32 *outLength*)

Convert UTF8 byte sequence to Unicode string.

The function converts UTF8 byte sequence (or ASCII sequence) to Unicode string. The length of input UTF8 byte sequence is specified. It stops at two conditions: (A) Whole input UTF8 byte sequence is successfully converted. (B) Output buferr is not enough for output, or parse error. In case of (A), it adds a terminated '\0' at the end of the output Unicode string, and returns length of the output Unicode string (without counting terminated '\0'). In case of (B), it converts as much as possible to the output buffer and adds a terminated '\0' at the end of the output Unicode string "(no '\0' added if outLength is less than or equal to 0, return 0)", and returns 0.

Parameters:

input Ptr to an input UTF8 byte sequence. '\0' termination is not necessary.

inLength The length of the input UTF8 byte sequence, without counting terminated '\0' (if any).

output Ptr to an output buffer which output Unicode string is written in.

outLength The size of output buffer, also the maximum number of oscl_wchar could be written in.

Returns:

Length of output (excludes '\0') : completely converts all input string and appends '\0' to output; 0 : insufficient buffer or error in conversion

Functions

- OSCL_IMPORT_REF bool **OSCL_IsErrnoSupported** ()
This function determines if a particular system saves the error number that occurs on a system call.
- OSCL_IMPORT_REF int **OSCL_GetLastError** ()
This function returns the value of the system's global error number variable.
- OSCL_IMPORT_REF bool **OSCL_SetLastError** (int newVal)

This function sets the last error code for the system.

- OSCL_IMPORT_REF char * **OSCL_StrError** (int errnum)

This function maps an error number to an error-message string.

6.5.1 Define Documentation

6.5.1.1 #define _PV_TRAP(__r, __s)

Value:

```
__r=OsclErrNone; \
{ \
    OsclErrorTrapImp* __tr=OsclErrorTrapImp::Trap(); \
    if(!__tr){__s;}else{ \
        try{__s;} \
        catch(internalLeave __lv){ \
            __lv.a=__r=__tr->iLeave; } \
            __tr->UnTrap(); } \
    } 
```

6.5.1.2 #define _PV_TRAP_NO_TLS(__trapimp, __r, __s)

Value:

```
__r=OsclErrNone; \
{ \
    OsclErrorTrapImp* __tr=OsclErrorTrapImp::TrapNoTls(__trapimp); \
    if(!__tr){__s;}else{ \
        try{__s;} \
        catch(internalLeave __lv){ \
            __lv.a=__r=__tr->iLeave; } \
            __tr->UnTrap(); } \
    } 
```

6.5.1.3 #define internalLeave (-1)

6.5.1.4 #define OSCL_BAD_ALLOC_EXCEPTION_CODE OsclErrNoMemory

6.5.1.5 #define OSCL_CATCH(_leave_status, _catch_value, _statements) else if (_leave_status!=OsclErrNone && _leave_status == _catch_value){_statements;}

Use this macro to define a block of code for catching additional exception types.

OSCL_FIRST_CATCH can be used to catch one exception type. Then the OSCL_CATCH macro can be used to catch each subsequent type. The catch block must end with OSCL_LAST_CATCH or OSCL_CATCH_ANY

Parameters:

oscl_leave_status is the result of any OSCL_THROW

exceptiontype is the exception handled by this catch block

**6.5.1.6 #define OSCL_CATCH_ANY(_leave_status, _statements) else if
(_leave_status!=OsclErrNone){ _statements;}**

Use this macro to call a function that will catch all remaining exception types.

Parameters:

_leave_status

_statements is a statement or block of statements to handle all remaining exception types. This macro ends the try block.

6.5.1.7 #define OSCL_ERR_NONE OsclErrNone

For backward compatibility with old definitions

**6.5.1.8 #define OSCL_FIRST_CATCH(_leave_status, _catch_value, _statements) if
(_leave_status!=OsclErrNone && _leave_status == _catch_value){_statements;}**

Use this macro to define a block of code that catches the first exception type thrown in the preceding try block.

Parameters:

oscl_leave_status is the leave code that was returned by OSCL_THROW

exceptiontype is the exception handled by this catch block. This macro MUST be used in conjunction with either OSCL_LAST_CATCH or OSCL_CATCH_ANY

**6.5.1.9 #define OSCL_FIRST_CATCH_ANY(_leave_status, _statements) if
(_leave_status!=OsclErrNone) { _statements; }**

This section defines the macros to be used in the catch block following the try block. Use this macro to call a function that handles all exception types thrown in the preceding try block.

Parameters:

_leave_status

_statements is a statement or block of statements that will catch all the exception types thrown by the preceding try block. This is a standalone macro and should not be used with any of the macros above

6.5.1.10 #define OSCL_JUMP_MAX_JUMP_MARKS OSCL_MAX_TRAP_LEVELS**6.5.1.11 #define OSCL_LAST_CATCH(_leave_status) else if (_leave_status!=OsclErrNone){OSCL_LEAVE(_leave_status);}**

Use this macro if OSCL_CATCH_ANY has not been used. It will mark the end of the catch block.

Parameters:

_leave_status will be propagated up the call stack. This macro will do an OSCL_LEAVE if the leave has not been handled by the calls above. This macro ends the try block.

6.5.1.12 #define OSCL_LEAVE(_leave_status) OsclError::Leave(_leave_status)

Use this macro to cause a Leave. It terminates the execution of the current active function.

It also tries to cleanup the items on the cleanup stack.

Parameters:

oscl_leave_status tells the cause for the Leave

6.5.1.13 #define OSCL_MAX_TRAP_LEVELS 20**6.5.1.14 #define OSCL_TRAPSTACK_POP() OsclError::Pop()****6.5.1.15 #define OSCL_TRAPSTACK_POPDEALLOC() OsclError::PopDealloc()****6.5.1.16 #define OSCL_TRAPSTACK_PUSH(a) OsclError::PushL(a)**

Cleanup Stack user macros

6.5.1.17 #define OSCL_TRY(_leave_status, _statements) _PV_TRAP(_leave_status, _statements)

This macro will be used to set up a try block.

The try block identifies a block of code that might throw exceptions (or leave)

Parameters:

oscl_leave_status oscl_leave_status will receive the result of any OSCL_LEAVE (which will get called from a OSCL_THROW) on systems that do not support exception handling. This is unused on systems that do support exception handling

statements is a statement or block of statements that could throw exceptions and will be executed in the try block

6.5.1.18 #define OSCL_TRY_NO_TLS(__trapimp, _leave_status, _statements)

6.5.2.3 typedef void(* OsclTrapOperation)(OsclAny*)

OsclTrapItem may be used in the cleanup stack when a custom cleanup operation is needed.

6.5.3 Function Documentation

6.5.3.1 OSCL_IMPORT_REF int OSCL_GetLastError ()

This function returns the value of the system's global error number variable.

Returns:

Returns 0 for system's that do not have this functionality The value of the error number variable does not change until the user calls SetLastError or if another system call occurs that changes the value

Supported Platforms: Win32/wince, Unix Unsupported Platforms : Symbian

6.5.3.2 OSCL_IMPORT_REF bool OSCL_IsErrnoSupported ()

This function determines if a particular system saves the error number that occurs on a system call.

Returns:

This method returns false on systems that do not save the error number that occurs on a system call in a global variable. Returns true for systems that do save the error number

6.5.3.3 OSCL_IMPORT_REF bool OSCL_SetLastError (int *newVal*)

This function sets the last error code for the system.

Parameters:

newVal This value represents the new value for the global error number This method can be used to reset the error number after having retrieved it using GetLastError. Supported Platforms: Win32/wince, Unix Unsupported Platforms : Symbian

6.5.3.4 OSCL_IMPORT_REF char* OSCL_StrError (int *errnum*)

This function maps an error number to an error-message string.

Parameters:

errnum This value represents the error number to map

Returns:

This method returns a pointer to a string containing the system error-message. It returns NULL for systems that do not have this functionality Supported Platforms: Win32/wince, Unix Unsupported Platforms : Symbian

6.6.4 Function Documentation

6.6.4.1 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_chdir (const char **path*)

oscl_chdir changes the current directory to the path given

Parameters:

character path the full path of the directory to change to.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.2 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_chdir (const oscl_wchar **path*)

oscl_chdir changes the current directory to the path given

Parameters:

wide character path the full path of the directory to change to.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.3 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_getcwd (char *path, uint32 size)

oscl_getcwd function can be used to determine the full path name of the current directory.

Parameters:

pointer to character buffer to receive the current directory
size size of buffer in characters

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.4 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_getcwd (oscl_wchar *path, uint32 size)

oscl_getcwd function can be used to determine the full path name of the current directory.

Parameters:

pointer to wide character buffer to receive the current directory
size size of buffer in wide characters

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.5 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_mkdir (const char *path)

oscl_mkdir function creates a directory in the path given

Parameters:

character path the full path of the directory to create. if parts of the path do not exist the function will fail

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.6 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_mkdir (const oscl_wchar *path)

oscl_mkdir function creates a directory in the path given

Parameters:

wide character path the full path of the directory to create. if parts of the path do not exist the function will fail

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

**6.6.4.7 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_rename (const char *
oldpath, const char **newpath*)**

oscl_rmdir removes an empty directory in the path given

Parameters:

character path the full path of the directory to remove.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

**6.6.4.8 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_rename (const oscl_wchar
** oldpath*, const oscl_wchar **newpath*)**

oscl_rename function renames a file or directory

Parameters:

wide character path the full path of the file or directory to rename.

wide character path the full path the new name for the directory

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.9 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_rmdir (const char **path*)

oscl_rmdir removes an empty directory in the path given

Parameters:

character path the full path of the directory to remove.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

**6.6.4.10 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_rmdir (const oscl_wchar *
path)**

oscl_rmdir function removes and empty directory in the path given

Parameters:

wide character path the full path of the directory to remove.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.11 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_stat (const char *path, OSCL_STAT_BUF *statbuf)

oscl_stat function can be used to determine the attributes of a file in addition to whether the file exists or not

Parameters:

character path the full path of the file to stat.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.12 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_stat (const oscl_wchar * path, OSCL_STAT_BUF *statbuf)

oscl_stat function can be used to determine the attributes of a file in addition to whether the file exists or not

Parameters:

wide character path the full path of the file to stat.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.13 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_statsfs (OSCL_FSSTAT * stats, const oscl_wchar *path)

Oscl_StatFS function populates a general structure describing free space available on a filesystem

Parameters:

stats pointer to structure to hold information

path located in desired filesystem (utf8) Note: If the OS does not support a particular field in the structure, it is set to -1.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

6.6.4.14 OSCL_IMPORT_REF OSCL_FILEMGMT_ERR_TYPE oscl_statsfs (OSCL_FSSTAT * stats, const char *path)

Oscl_StatFS function populates a general structure describing free space available on a filesystem

Parameters:

stats pointer to structure to hold information

path located in desired filesystem (utf8) Note: If the OS does not support a particular field in the structure, it is set to -1.

Returns:

OSCL_FILEMGMT_ERR_TYPE, see enumeration for this type.

Public Methods

- [OsclAny * allocate \(const uint32 size\)](#)
- [void deallocate \(OsclAny *p\)](#)
- [virtual ~_OsclBasicAllocator \(\)](#)

7.1.1 Detailed Description

A basic allocator that does not rely on other modules. There is no memory auditing or exception generation.

Note: this allocator is for internal use by Oscl code only. Higher level code should use [OsclMemAllocator](#) defined in "[oscl_mem.h](#)".

7.12.2 Member Function Documentation

7.12.2.1 template<class Alloc> void CallbackTimer< Alloc >::Run () [inline, virtual]

Handles an active object's request completion event.

A derived class must provide an implementation to handle the completed request. If appropriate, it may issue another request.

The function is called by the active scheduler when a request completion event occurs, i.e. after the active scheduler's WaitForAnyRequest() function completes.

Before calling this active object's [Run\(\)](#) function, the active scheduler has:

1. decided that this is the highest priority active object with a completed request
2. marked this active object's request as complete (i.e. the request is no longer outstanding)

[Run\(\)](#) runs under a trap harness in the active scheduler. If it leaves, then the active scheduler calls ExecError() to handle the leave.

Note that once the active scheduler's Start() function has been called, all user code is run under one of the program's active object's [Run\(\)](#) or [RunError\(\)](#) functions.

Implements [PVActiveBase](#).

Inheritance diagram for HeapBase::

Public Methods

- [HeapBase \(\)](#)

7.20.1 Detailed Description

HeapBase is the base class for all classes that allocates memory.

HeapBase has overloaded new and delete operators.

Derived from [_OsclHeapBase](#) providing CBase* alike pointer and virtual destructor for cleanupstack to Push and Pop for cleanup when leave occurs.

HeapBase has a virtual destructor which calls the destructor of all the derived classes.

7.32.2.6 bool MM_Audit_Imp::isSetFailure (OsclMemStatsNode * statsNode)**7.32.2.7 bool MM_Audit_Imp::isSetFailure (const char * tagIn)****Returns:**

true if operation succeeds;

7.32.2.8 void MM_Audit_Imp::makeValidTag (const char * tagIn, MMAuditCharAutoPtr & autoptr)**Returns:**

a valid tag; NULL will be converted into root tag

7.32.2.9 OSCL_IMPORT_REF bool MM_Audit_Imp::MM_AddTag (const char * tagIn) [inline]

API to add a node and zero out its counters; Note that this tag should be re-used

Parameters:

tagIn input tag

Returns:

true if operation succeeds;

7.32.2.10 OSCL_IMPORT_REF void* MM_Audit_Imp::MM_allocate (const OsclMemStatsNode * statsNode, uint32 sizeIn, const char * pFileName, uint32 lineNumber, bool allocNodeTracking = false)

The following are APIs t __nothrow_ / const __nothrow_

Returns:

the memory pointer if operation succeeds.

7.32.2.11 OSCL_IMPORT_REF MM_AllocQueryInfo* MM_Audit_Imp::MM_CreateAllocNode-Info (uint32 max_array_size)

These APIs will allocate and release space for alloc node info, to be used with the MM_GetAllocNodeInfo API.

7.32.2.12 OSCL_IMPORT_REF bool MM_Audit_Imp::MM_deallocate (void * pMemBlockIn)**Returns:**

true if operation succeeds;

7.32.2.13 uint32 MM_Audit_Imp::MM_GetAllocNo (void) [inline]

API to get the current allocation number

Returns:

the current allocation number

**7.32.2.14 OSCL_IMPORT_REF uint32 MM_Audit_Imp::MM_GetAllocNodeInfo
(MM_AllocQueryInfo * output_array, uint32 max_array_size, uint32 offset)**

API to query the list of alloc nodes. It copies the information into the provided output array.

Parameters:

output_array the array where the data will be written

max_array_size the max number of output array elements

offset the offset into the alloc node list from which the data should begin.

Returns:

the number of valid nodes in the output array

**7.32.2.15 OSCL_IMPORT_REF const OsclMemStatsNode* MM_Audit_Imp::MM_GetExisting-
Tag (const char * tagIn)**

API to add a node and zero out its counters; Note that this tag should be re-used

Parameters:

tagIn input tag

Returns:

true if operation succeeds;

7.32.2.16 uint32 MM_Audit_Imp::MM_GetMode (void) [inline]

API to get the operating mode of the mm_audit class.

7.32.2.17 uint32 MM_Audit_Imp::MM_GetNumAllocNodes () [inline]

API to get the number of allocation nodes (records) for allocations that are being tracked individually.

**7.32.2.18 void MM_Audit_Imp::MM_GetOverheadStats (MM_AuditOverheadStats & stats)
[inline]**

API to get the overhead statistics for the memory used by the mm_audit class.

7.32.2.19 uint32 MM_Audit_Imp::MM_GetPostfillPattern (void) [inline]

API to get the postfill pattern. The pattern is used to fill the memory before freeing it.

7.32.2.20 uint8 MM_Audit_Imp::MM_GetPrefillPattern (void) [inline]

API to get the prefill pattern. The pattern is used to fill the memory before returning it to the caller.

7.32.2.21 OSCL_IMPORT_REF const OsclMemStatsNode* MM_Audit_Imp::MM_GetRootNode () [inline]**7.32.2.22 OSCL_IMPORT_REF MM_Stats_t* MM_Audit_Imp::MM_GetStats (const char *const tagIn)**

API to get memory statistics through context string(tag)

Returns:

statistics pointer if operation succeeds

7.32.2.23 OSCL_IMPORT_REF uint32 MM_Audit_Imp::MM_GetStatsInDepth (const char * tagIn, MM_Stats_CB * array_ptr, uint32 max_nodes)

API to get memory statistics in detail through context string(tag) including its subtree

Returns:

statistics pointer array and actual number of nodes if operation succeeds

7.32.2.24 OSCL_IMPORT_REF const OsclMemStatsNode* MM_Audit_Imp::MM_GetTagName (const char * tagIn)

API to add a node and zero out its counters; Note that this tag should be re-used

Parameters:

tagIn input tag

Returns:

pointer to [OsclMemStatsNode](#) which should be passed to MM_allocate

7.32.2.25 OSCL_IMPORT_REF uint32 MM_Audit_Imp::MM_GetTreeNodes (const char * tagIn)

API to get the number of tree nodes including the tag node and its subtree

Parameters:

tagIn input tag

Returns:

the number of tree nodes ; 0 means no tag node

**7.32.2.26 OSCL_IMPORT_REF void MM_Audit_Imp::MM_ReleaseAllocNodeInfo
([MM_AllocQueryInfo](#) * *info*)**

**7.32.2.27 OSCL_IMPORT_REF bool MM_Audit_Imp::MM_SetFailurePoint (const char * *tagIn*,
uint32 *alloc_number*)**

API to insert allocation failure deterministically according to allocation number associated with tag

Parameters:

tagIn input tag

alloc_number allocation number associated with tag

Returns:

true if operation succeeds;

7.32.2.28 OSCL_IMPORT_REF void MM_Audit_Imp::MM_SetMode (uint32 *inMode*)

API to set the operating mode of the mm_audit class.

7.32.2.29 OSCL_IMPORT_REF void MM_Audit_Imp::MM_SetPostfillPattern (uint8 *pattern*)

API to set the postfill pattern.

7.32.2.30 OSCL_IMPORT_REF void MM_Audit_Imp::MM_SetPrefillPattern (uint8 *pattern*)

API to set the prefill pattern.

7.32.2.31 OSCL_IMPORT_REF void MM_Audit_Imp::MM_SetTagLevel (uint32 *level*)

API to set the maximum tag level,i.e. tag level for a.b.c.d = 4

Parameters:

level input tag level to be set

**7.32.2.32 OSCL_IMPORT_REF void MM_Audit_Imp::MM_UnsetFailurePoint (const char *
tagIn)**

API to cancel the allocation failure point associated with tag

Parameters:

tagIn input tag

7.32.2.33 OSCL_IMPORT_REF bool MM_Audit_Imp::MM_Validate (const void * *ptrIn*)

API to check the input pointer is a valid pointer to a chunk of memory

Parameters:

ptrIn input pointer to be validated

Returns:

true if operation succeeds;

7.32.2.34 `bool MM_Audit_Imp::pruneSubtree (const char * tagIn)`

7.32.2.35 `bool MM_Audit_Imp::pruneSubtree (OsclMemStatsNode * pNode)`

Returns:

true if operation succeeds;

7.32.2.36 `void MM_Audit_Imp::removeALLAllocNodes ()`

7.32.2.37 `OsclMemStatsNode* MM_Audit_Imp::removeAllocNode (void * pMemBlockIn, uint32 & size)`

Returns:

true if operation succeeds;

7.32.2.38 `void MM_Audit_Imp::retrieveParentTag (char * tag)`

7.32.2.39 `int32 MM_Audit_Imp::retrieveParentTagLength (const char * tag, int32 bound)`

Returns:

the length of a immediate parent tag for the input tag

7.32.2.40 `bool MM_Audit_Imp::updateStatsNode (OsclMemStatsNode * pCurrStatsNode, const MM_Stats_t & pDelta, bool bAdd)`

Returns:

true if operation succeeds;

7.32.2.41 `bool MM_Audit_Imp::updateStatsNodeInFailure (OsclMemStatsNode * pStatsNode)`

7.32.2.42 `bool MM_Audit_Imp::updateStatsNodeInFailure (const char * tagIn)`

Returns:

true if operation succeeds;

7.32.2.43 `bool MM_Audit_Imp::validate (void * ptrIn) [static]`

Returns:

true if operation succeeds;

7.32.2.44 bool MM_Audit_Imp::validate_all_heap ()**Returns:**

- **void set_from_system_time (const uint32 systemtime)**
This method converts a 32-bit system time to NTP time.
- **OSCL_COND_IMPORT_REF uint32 get_middle32 () const**
Grab the middle 32 bits of the 64 bit 32.32 representation.
- **OSCL_COND_IMPORT_REF uint32 get_upper32 () const**
This method returns the upper 32 bits of the 32.32 representation.
- **OSCL_COND_IMPORT_REF uint32 get_lower32 () const**
This method returns the lower 32 bits of the 32.32 representation.

- int32 [to_system_time \(\) const](#)

This method converts the ntp time value to system time.

- OSCL_COND_IMPORT_REF [uint64 get_value \(\) const](#)

This method returns the 32.32 ntp representation.

- OSCL_IMPORT_REF int [set_to_current_time \(\)](#)

This method sets the 32.32 representation to the current system time value.

7.37.1 Detailed Description

The NTPTime class represents a time value as the number of seconds since 0h (UTC) Jan. 1, 1900.

The NTPTime class: Conversion to/from Unix (epoch at 0h Jan. 1, 1970) amount to addition/subtraction of 2208988800. A single 64 bit value is used to represent the time. This value represents the number of seconds since 0h (UTC) Jan. 1, 1900. There is an implied binary point between the upper 32 bits and lower 32 bits (this is referred to as a 32.32 fractional representation). For example a binary value of 00000000 00000000 00000011 10000000 00000000 00000000 00000000 represents 3.5 seconds since Jan 1, 1900.

7.37.2 Constructor & Destructor Documentation

7.37.2.1 OSCL_COND_IMPORT_REF NTPTime::NTPTime ()

The default constructor creates an NTPTime instance representing the current system time.

7.37.2.2 OSCL_COND_IMPORT_REF NTPTime::NTPTime (const NTPTime & src)

Copy constructor to create a new NTPTime from an existing one.

7.37.2.3 OSCL_COND_IMPORT_REF NTPTime::NTPTime (const uint32 seconds)

Construct an NTPTime from a uint32.

Parameters:

seconds The uint32 input represents the number of seconds since Jan. 1, 1900.

7.37.2.4 OSCL_COND_IMPORT_REF NTPTime::NTPTime (const int32 seconds)

Construct an NTPTime from a int.

Parameters:

seconds The int input represents the number of seconds since Jan. 1, 1900.

7.37.2.5 OSCL_COND_IMPORT_REF NTPTime::NTPTime (const TimeValue & t)

Construct a NTPTime instance from a TimeValue instance.

This constructor creates an NTPTime value representing the same absolute time as the TimeValue parameter.

Parameters:

t A reference to a TimeValue object.

7.37.2.6 OSCL_COND_IMPORT_REF NTPTime::NTPTime (const uint64 value)

Construct a NTPTime instance from a uint64 value.

Parameters:

value A 64 bit integer argument which is used as the ntp 32.32 fractional representation.

7.37.3 Member Function Documentation

7.37.3.1 OSCL_COND_IMPORT_REF uint32 NTPTime::get_lower32 ()

This method returns the lower 32 bits of the 32.32 representation.

7.37.3.2 OSCL_COND_IMPORT_REF uint32 NTPTime::get_middle32 ()

Grab the middle 32 bits of the 64 bit 32.32 representation.

7.37.3.3 OSCL_COND_IMPORT_REF uint32 NTPTime::get_upper32 ()

This method returns the upper 32 bits of the 32.32 representation.

7.37.3.4 OSCL_COND_IMPORT_REF uint64 NTPTime::get_value ()

This method returns the 32.32 ntp representation.

7.37.3.5 OSCL_COND_IMPORT_REF NTPTime& NTPTime::operator+= (uint64 val)

The += operator is used to add a 64 bit 32.32 value to an existing NTPTime value.

Parameters:

val The 64 bit 32.32 value to add to this object's value.

7.37.3.6 OSCL_COND_IMPORT_REF NTPTime NTPTime::operator- (const NTPTime & npt) const

The - operator allows subtraction of one NTPTime value from another. This is useful to measure an interval.

Parameters:

npt A reference to the NTPTime object to be subtracted from this one.

7.37.3.7 OSCL_COND_IMPORT_REF NTPTime& NTPTime::operator= (*uint64 newval*)

The assignment operator for a 64 bit integer.

Parameters:

newval A 64 bit value which represents the 32.32 fractional representation of the ntp time.

7.37.3.8 OSCL_COND_IMPORT_REF NTPTime& NTPTime::operator= (*uint32 newval*)

The assignment operator for a 32 bit integer.

Parameters:

newval A 32 bit integer representing the upper 32 bits of the 32.32 NTP time (e.g. the number of whole seconds since Jan 1, 1900 UTC).

7.37.3.9 void NTPTime::set_from_system_time (*const uint32 systemtime*)

This method converts a 32-bit system time to NTP time.

This method sets the value of the NTPTime instance to the absolute time represented by the 32 bit input argument.

Parameters:

systemtime This 32-bit value is interpreted as the number of seconds since the unix epoch Jan. 1 1970.

7.37.3.10 OSCL_IMPORT_REF int NTPTime::set_to_current_time ()

This method sets the 32.32 representation to the current system time value.

7.37.3.11 int32 NTPTime::to_system_time ()

This method converts the ntp time value to system time.

This method returns a 32 bit value representing the same absolute time as the NTP time value, but expressed as whole seconds since the unix epoch. The fractional part of the ntp value is discarded.

- class `OSCL_String`

7.42.1 Detailed Description

`OSCL_FastString` is a simple string class, compatible with regular character array strings.

This class does not allocate internal memory for the string but acts as a container for a user-defined buffer. This means no copying of the string is done and provides a faster way of manipulating strings. Depending on initialization, this container provides either read-only or read-write access to the string.

Implementation assumes the input string is null-terminated.

Parameters:

C: type of character.

7.42.2 Member Typedef Documentation

7.42.2.1 `typedef OSCL_String::chartype OSCL_FastString::chartype`

Reimplemented from [OSCL_String](#).

7.42.2.2 `typedef TOSCL_StringOp OSCL_FastString::optype`

7.42.2.3 `typedef OSCL_wString::chartype OSCL_FastString::other_chartype`

7.42.3 Constructor & Destructor Documentation

7.42.3.1 `OSCL_IMPORT_REF OSCL_FastString::OSCL_FastString()`

Default constructor.

7.42.3.2 `OSCL_IMPORT_REF OSCL_FastString::OSCL_FastString(const OSCL_FastString &src)`

Creates a fast string that contains a copy of the input string. The string inherits the writable-ness of the source string.

Parameters:

src: input string.

7.42.3.3 `OSCL_IMPORT_REF OSCL_FastString::OSCL_FastString(const chartype *cstr)`

Create the string and initialize it to contain the input string. The string is not writable.

am: **null-terminated string.**

7.42.3.4 `OSCL_IMPORT_REF OSCL_FastString::OSCL_FastString(chartype *buf, uint32 maxlen)`

Create the string and initialize it to contain the input string. The string is writable.

Parameters:

cp: null-terminated string.

maxlen: maximum size of storage at *cp*, not incl null terminator. If input string is not null-terminated, the function leaves.

7.42.3.5 OSCL_IMPORT_REF OSCL_FastString::~OSCL_FastString ()**7.42.4 Member Function Documentation****7.42.4.1 OSCL_IMPORT_REF const chartype* OSCL_FastString::get_cstr () [virtual]**

This function returns the C-style string for read access.

Implements [OSCL_String](#).

7.42.4.2 OSCL_IMPORT_REF uint32 OSCL_FastString::get_maxsize () [virtual]

This function returns the maximum available storage size, not including null terminator. The maximum size may be larger than the current string size.

Implements [OSCL_String](#).

7.42.4.3 OSCL_IMPORT_REF uint32 OSCL_FastString::get_size () [virtual]

Pure virtuals from [OSCL_String](#)

Implements [OSCL_String](#).

7.42.4.4 OSCL_IMPORT_REF chartype* OSCL_FastString::get_str () [virtual]

This function returns the C-style string for write access. If the string is not writable it returns NULL.

Implements [OSCL_String](#).

7.42.4.5 OSCL_IMPORT_REF OSCL_FastString& OSCL_FastString::operator= (const chartype * cstr)

Assignment operator

am: null-terminated string

Reimplemented from [OSCL_String](#).

7.42.4.6 OSCL_IMPORT_REF OSCL_FastString& OSCL_FastString::operator= (const OSCL_FastString & src)

Assignment operators

7.42.4.7 OSCL_IMPORT_REF void OSCL_FastString::set (const other_chartype * buf, uint32 numofbyte, optype op)

Set the contents of this string to a new string or character array, with conversion operation.

Parameters:

buf: string or character array.

numofbyte: number of bytes available in the buffer. There must be enough space available for the converted string including its NULL terminator. The converted string may be smaller or larger than the original string.

op: conversion operation to apply If numofbyte is not large enough for conversion, the function leaves. If input string is not null-terminated, the function leaves.

7.42.4.8 OSCL_IMPORT_REF void OSCL_FastString::set ([chartype](#) * *cstr*, uint32 *maxlen*)

This function can be used to reassign the string to a new writable string. If input string is not null-terminated, the function leaves.

7.42.4.9 OSCL_IMPORT_REF void OSCL_FastString::set_length ()

This function can be used to refresh the string size in case the contents of the string buffer have been modified since the container was created.

7.43.1 Member Enumeration Documentation

7.43.1.1 enum Oscl_File::mode_type

Enumeration values:

MODE_READ Opens a file for reading. The file must exist.

MODE_READWRITE Opens the file for reading and writing. If the file exists, its contents will be overwritten unless APPEND mode is specified. If the file does not exist, it will be created.

MODE_APPEND Specifies all write operations to occur at the end of the file. The file pointer can be moved with the Seek command, but will always be moved to the end of the file for write commands.

MODE_BINARY Opens the file in 'binary' mode. This is the default.

MODE_TEXT Opens the file in 'text' mode. The default mode is 'binary'.

MODE_READ_PLUS Open a file for reading and writing. The file must exist. The default mode is 'binary'.

7.43.1.2 enum Oscl_File::seek_type

Enumeration values:

SEEKSET Beginning of file

SEEKCUR Current position of file pointer

SEEKEND End of file

7.43.1.3 enum Oscl_File::TSymbianAccessMode

Defines mode options for SetNativeAccessMode on Symbian.

Enumeration values:

ESymbianAccessMode_Rfile

ESymbianAccessMode_RfileBuf

7.43.2 Constructor & Destructor Documentation

7.43.2.1 OSCL_IMPORT_REF Oscl_File::Oscl_File ()

Constructor

7.43.2.2 OSCL_IMPORT_REF Oscl_File::Oscl_File (uint32 *aCacheSize*)

Deprecated Constructor, present for back-compatibility.

Parameters:

aCacheSize: sets native buffer size, and when pv cache is enabled, also sets pv cache size.

7.43.2.3 OSCL_IMPORT_REF Oscl_File::Oscl_File (uint32 *aCacheSize*, **OsclFileHandle** * *aFileHandle*)

Deprecated Constructor, present for back-compatibility.

Parameters:

aCacheSize: sets native buffer size, and when pv cache is enabled, also sets pv cache size.

aFileHandle: open file handle.

7.43.2.4 OSCL_IMPORT_REF Oscl_File::~Oscl_File ()

Destructor

7.43.3 Member Function Documentation

7.43.3.1 void Oscl_File::AddFixedCache (const **OsclFixedCacheParam** & *aParam*) [inline]

AddFixedCache adds a fixed cache. The fixed cache will be used on the next opportunity. The fixed cache must not overlap with any other fixed cache.

Parameters:

aParam: Cache location and size.

7.43.3.2 OSCL_IMPORT_REF int32 Oscl_File::Close ()

The File Close operation Closes the file after flushing any remaining data in the buffers.

Note: If the file object was opened with an external file handle, then Close will simply flush the file. The file will remain open.

Returns:

returns 0 if successful, and a non-zero value otherwise

7.43.3.3 OSCL_IMPORT_REF int32 Oscl_File::EndOfFile ()

The File EOF(end of file) operation returns a nonzero value after the first read operation that attempts to read past the end of the file

Returns:

7.43.3.4 OSCL_IMPORT_REF int32 Oscl_File::Flush ()

The File Flush operation On an output stream OSCL_FileFlush causes any buffered but unwritten data to be written to the file.

Returns:

returns 0 if successful, and a non-zero value otherwise

7.43.3.5 OSCL_IMPORT_REF int32 Oscl_File::GetError ()

The File Error operation If no error has occurred on stream, returns 0. Otherwise, it returns a nonzero value

Returns:

7.43.3.6 OsclFileHandle* Oscl_File::Handle () [inline]

Retrieve the file handle.

Returns:

file handle

7.43.3.7 OSCL_IMPORT_REF int32 Oscl_File::Open (const oscl_wchar *filename, uint32 mode, Oscl_FileServer &fileserv)

Opens a file.

Note: when an external file handle is used, Open will attach to the file handle and initialize cacheing features, but will not do a native file open.

Parameters:

filename name of file to open (Unicode)

mode combination of open mode flags

fileserv fileserv to use

Returns:

returns 0 if successful and a non-zero value otherwise

7.43.3.8 OSCL_IMPORT_REF int32 Oscl_File::Open (const char *filename, uint32 mode, Oscl_FileServer &fileserv)

Opens a file.

Note: when an external file handle is used, Open will attach to the file handle and initialize cacheing features, but will not do a native file open.

Parameters:

filename name of file to open (Utf8)
mode combination of open mode flags
fileserv fileserv to use

Returns:

returns 0 if successful and a non-zero value otherwise

7.43.3.9 OSCL_IMPORT_REF uint32 Oscl_File::Read (OsclAny *buffer, uint32 size, uint32 numelements)

The File Read operation Reads from the file into the buffer a maximum of 'numelements' of size 'size'.

Parameters:

buffer pointer to buffer of type void
size element size in bytes
numelements max number of elements to read

Returns:

returns the number of full elements actually read, which may be less than count if an error occurs or if the end of the file is encountered before reaching count. Use the CheckEndOfFile or GetError function to distinguish a read error from an end-of-file condition.

7.43.3.10 void Oscl_File::RemoveFixedCache (const TOsclFileOffset &aPos) [inline]

RemoveFixedCache removes a fixed cache.

Parameters:

aPos: Cache location and size.

7.43.3.11 OSCL_IMPORT_REF int32 Oscl_File::Seek (TOsclFileOffset offset, seek_type origin)

The File Seek operation Sets the position for file pointer

Parameters:

offset offset from the specified origin.
origin starting point

Returns:

returns 0 on success, and a non-zero value otherwise

7.43.3.12 OSCL_IMPORT_REF void Oscl_File::SetAsyncReadBufferSize (uint32 *aSize*)

SetAsyncReadBufferSize configures the asynchronous background read function. May not be available on all platforms.

This should be called before opening the file. If used when the file is open, the option will not take effect until the next Open.

Note: if asynchronous read is not available on the platform, this call will have no effect.

Parameters:

aSize: buffer size in bytes. Zero disables the feature.

7.43.3.13 void Oscl_File::SetCacheObserver ([OsclCacheObserver](#) * *aObs*) [inline]**7.43.3.14 OSCL_IMPORT_REF int32 Oscl_File::SetFileHandle ([OsclFileHandle](#) * *aHandle*)**

SetFileHandle adds an open file handle to the Oscl_File object. The Oscl_File object will use that handle to access the file.

This call is not available when the Oscl_File object is already open.

Note: This feature is used in Symbian with the MMF framework. The MMF framework provides an open RFile handle to access content. When using RFileBuf access mode with an RFile handle, the RFileBuf will be attached to the open RFile handle.

To use the external file handle, the caller starts with a native file handle to an open file. The caller must wrap the native file handle in an [OsclFileHandle](#) object, pass the [OsclFileHandle](#) pointer to SetFileHandle, call [Oscl_File::Open](#), then proceed to use the Oscl_File object, finally calling [Oscl_File::Close](#). In this usage mode, [Oscl_File::Open](#) and [Oscl_File::Close](#) do not actually call native file open and close. It is assumed that the caller will close the original native file handle after usage is complete.

Parameters:

aHandle: container for an open file handle.

Returns:

returns 0 if successful, non-zero if error.

7.43.3.15 OSCL_IMPORT_REF void Oscl_File::SetLoggingEnable (bool *aEnable*)

SetLoggingEnable configures the [PVLogger](#) output for this file. This will enable full logging of each API entry and exit using the logger object "Oscl_File", plus full logging of native operation entry & exit using logger object "OsclNativeFile".

Parameters:

aEnable: true to enable, false to disable logging.

7.43.3.16 OSCL_IMPORT_REF void Oscl_File::SetNativeAccessMode (uint32 *aMode*)

SetNativeAccessMode allows switching between different native file access modes, when available.

Note: for Symbian, use the TSymbianAccessMode values to choose the mode. If multiple access modes are not available on the platform, this call will have no effect.

Parameters:

aMode: access mode.

7.43.3.17 OSCL_IMPORT_REF void Oscl_File::SetNativeBufferSize (int32 *aSize*)

SetNativeBufferSize configures the native file buffering feature, when available.

This should be called before opening the file. If used when the file is open, the option will not take effect until the next Open.

Note: For Symbian, this sets the RFileBuf cache size. If native buffering is not available on the platform, this call will have no effect.

Parameters:

aSize: native buffer size in bytes. Zero disables the feature.

7.43.3.18 OSCL_IMPORT_REF void Oscl_File::SetPVCacheSize (uint32 *aSize*)

SetPVCacheSize configures the read/write cache.

This should be called before opening the file. If used when the file is open, the option will not take effect until the next Open.

Parameters:

aSize: cache size in bytes. Zero disables the cache.

7.43.3.19 OSCL_IMPORT_REF int32 Oscl_File::SetSize (uint32 *size*)

The File SetSize operation If the file has been opened for writing This sets the size of the file. The file pointer position is unchanged unless the pointers position is greater than the new filesize.

Returns:

returns 0 if successful, and a non-zero value otherwise

7.43.3.20 OSCL_IMPORT_REF void Oscl_File::SetSummaryStatsLoggingEnable (bool *aEnable*)

SetSummaryStatsLoggingEnable configures the [PVLogger](#) output for this file. This will enable summary statistics logging only, using the logger object "[OsclFileStats](#)".

Parameters:

aEnable: true to enable, false to disable stats logging.

7.43.3.21 OSCL_IMPORT_REF [TOscOfFileOffset](#) Oscl_File::Size ()

Get the file size in bytes.

Returns:

- The size of the file, or -1 on error.

7.43.3.22 OSCL_IMPORT_REF [TOsclFileOffset](#) Oscl_File::Tell ()

The File Tell operation Returns the current file position for file specified by fp

7.43.3.23 OSCL_IMPORT_REF uint32 Oscl_File::Write (const [OsclAny](#) * *buffer*, uint32 *size*, uint32 *numelements*)

The File Write operation Writes from the buffer '*numelements*' objects of size '*size*'

Parameters:

buffer pointer to buffer of type void

size element size in bytes

numelements number of elements to write

Returns:

The number of elements written

7.46.4.2 OSCL_IMPORT_REF const oscl_wchar* Oscl_FileFind::FindFirst (const oscl_wchar * directory, const oscl_wchar * pattern, oscl_wchar * buf, uint32 buflen)

Opens a directory for reading.

Parameters:

directory directory to search (utf16).

pattern wildcard pattern filter (utf16). passing NULL, results in a universal match.

buf buffer for returned pathname (utf16).

buflen size in wide characters of buf. If buf is not large enough to hold the returned string, NULL is returned, and GetLastError is set to E_BUFFER_TOO_SMALL.

Returns:

returns a pointer to buffer supplied, which contains the pathname of the first found element, or NULL otherwise. On a NULL return value, [GetLastError\(\)](#) returns a more detailed error.

7.46.4.3 OSCL_IMPORT_REF const char* Oscl_FileFind::FindFirst (const char * *directory*, const char * *pattern*, char * *buf*, uint32 *buflen*)

Finds first element matching the pattern.

Parameters:

directory directory to search (utf8).

pattern wildcard pattern filter (utf8). passing NULL, results in a universal match.

buf buffer for returned pathname (utf8).

buflen size in wide characters of buf. If buf is not large enough to hold the returned string, NULL is returned, and GetLastError is set to E_BUFFER_TOO_SMALL.

Returns:

returns a pointer to buffer supplied, which contains the pathname of the first found element, or NULL otherwise. On a NULL return value, [GetLastError\(\)](#) returns a more detailed error.

7.46.4.4 OSCL_IMPORT_REF oscl_wchar* Oscl_FileFind::FindNext (oscl_wchar * *buf*, uint32 *buflen*)

Reads the next element in a directory. Note: the pointer returned by this function is not persistent and should be stored. Its scope is limited to the lifetime of the class.

Parameters:

buf buffer to hold directory name(utf16)

buflen size in wide characters of buf. If buf is not large enough to hold the returned string, NULL is returned, and GetLastError is set to E_BUFFER_TOO_SMALL.

Returns:

returns a pointer to buffer supplied, which contains the pathname of the next found element, or NULL otherwise. On a NULL return value, [GetLastError\(\)](#) returns a more detailed error.

7.46.4.5 OSCL_IMPORT_REF char* Oscl_FileFind::FindNext (char * *buf*, uint32 *buflen*)

Reads the next element in the directory. Note: the pointer returned by this function is not persistent and should be stored. Its scope is limited to the lifetime of the class.

Parameters:

buf buffer to hold directory name(utf8)

buflen size in wide characters of buf. If buf is not large enough to hold the returned string, NULL is returned, and GetLastError is set to E_BUFFER_TOO_SMALL.

Returns:

returns a pointer to buffer supplied, which contains the pathname of the next found element, or NULL otherwise. On a NULL return value, [GetLastError\(\)](#) returns a more detailed error.

7.46.4.6 OSCL_IMPORT_REF *element_type* Oscl_FileFind::GetElementType ()

Returns the element type for the last element returned

Returns:

7.49.1 Detailed Description

```
template<class Alloc> class OSCL_HeapString< Alloc >
```

OSCL_HeapString is a simple string class, compatible with regular character array strings.

The string array is variable length, is allocated from the heap, and is modifiable. A copy-on-write mechanism is used to minimize unnecessary copying when multiple instances of a string are created for reading. Allocated memory is automatically freed by the class destructor when the last string referencing the memory is destroyed.

The class HAS NO thread synchronization built-in, so it is NOT MT-SAFE. External locks should be used if the class is to be shared across threads.

Parameters:

Alloc: memory allocator, derived from [Oscl_DefAlloc](#).

7.50.1 Detailed Description

OSCL_HeapStringA is a simple string class, compatible with regular character array strings. It is similar to [OSCL_HeapString](#), except that the allocator is passed at run-time instead of compile-time. The allocator pointer is passed in the constructor, and may be a reference-counted object. If the allocator is not a reference-counted object then it must persist over the lifetime of all OSCL_HeapStringA objects that use it. If no allocator is provided, then an [OsclMemAllocator](#) will be used.

The string array is variable length, is allocated from the heap, and is modifiable. A copy-on-write mechanism is used to minimize unnecessary copying when multiple instances of a string are created for reading. Allocated memory is automatically freed by the class destructor when the last string referencing the memory is destroyed.

The class HAS NO thread synchronization built-in, so it is NOT MT-SAFE. External locks should be used if the class is to be shared across threads.

7.50.3 Constructor & Destructor Documentation

7.50.3.1 `OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA()`

The default constructor creates an empty string.

am: (optional) allocator or reference-counted allocator.

am: (optional) reference counter associated with allocator object.

If no allocator is provided, this object will use an [OsclMemAllocator](#).

7.50.3.2 `OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA (Oscl_DefAlloc *alloc, OsclRefCounter *ref = NULL)`

7.50.3.3 `OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA (const OSCL_HeapStringA & src)`

Creates a heap string that contains a copy of the input string.

Parameters:

src: input string.

am: (optional) allocator or reference-counted allocator.

am: (optional) reference counter associated with allocator object.

If no allocator is provided, this this object will use an [OsclMemAllocator](#).

7.50.3.4 OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA (const OSCL_HeapStringA & src, Oscl_DefAlloc * alloc, OsclRefCounter * ref = NULL)

7.50.3.6 OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA (const chartype * cstr, Oscl_DefAlloc * alloc = NULL, OsclRefCounter * ref = NULL)

Creates a heap string that contains a copy of the input string.

Parameters:

cp: null-terminated string.

am: (optional) allocator or reference-counted allocator.

am: (optional) reference counter associated with allocator object.

If no allocator is provided, this this object will use an [OsclMemAllocator](#).

7.50.3.7 OSCL_IMPORT_REF OSCL_HeapStringA::OSCL_HeapStringA (const chartype * buf, uint32 length, Oscl_DefAlloc * alloc = NULL, OsclRefCounter * ref = NULL)

Creates a heap string that contains a copy of the input string or character array.

Parameters:

src: character array, not necessarily null-terminated.

length: number of characters to copy.

am: (optional) allocator or reference-counted allocator.

am: (optional) reference counter associated with allocator object.

If no allocator is provided, this this object will use an [OsclMemAllocator](#).

7.50.4.8 OSCL_IMPORT_REF void OSCL_HeapStringA::set (const other_chartype * buf, uint32 length, optype op)

Set the contents of this string to a new string or character array, with conversion operation.

Parameters:

buf: string or character array.

length: number of characters to copy.

op: conversion operation to apply

7.50.4.9 OSCL_IMPORT_REF void OSCL_HeapStringA::set (const **other_chartype** * *buf*, **optype** *op*)

Set the contents of this string to a new string, with conversion operation.

Parameters:

buf: NULL-terminated wide string.

op: conversion operation to apply

7.50.4.10 OSCL_IMPORT_REF void OSCL_HeapStringA::set (const **chartype** * *buf*, uint32 *length*)

Set the contents of this string to a new string or character array.

Parameters:

buf: string or character array.

length: number of characters to copy.

Returns:

32-bit interger ,if next element is found in list,it returns 1 otherwise it returns 0

7.53.3.10 template<class LLClass, class Alloc> int32 Oscl_Linked_List< LLClass, Alloc >::get_num_elements () [inline]

Get number of elements in the list.

Returns:

32-bit integer, number of elements in list.

7.53.3.11 template<class LLClass, class Alloc> int32 Oscl_Linked_List< LLClass, Alloc >::insert_element (const LLClass & *new_element*, int *index*) [inline]

Inserts new element in the list. If the index is past the end of the list it creates the list and add the element as first element of list.

Parameters:

new_element the element to be add in the list.

Returns:

32-bit integer on the success returns 1.

7.53.3.12 template<class LLClass, class Alloc> int32 Oscl_Linked_List< LLClass, Alloc >::move_to_end (const LLClass & *data_to_move*) [inline]

Moves the element to end of the list

Returns:

On success returns 1 otherwise returns 0.

7.53.3.14 template<class LLClass, class Alloc> int32 Oscl_Linked_List< LLClass, Alloc >::remove_element (const int32 *index_to_remove*) [inline]

Removes the element for requested index.

Parameters:

index_to_remove

Returns:

on success return 1 otherwise return 0.

Reimplemented from [Oscl_Linked_List_Base](#).

7.53.3.15 template<class LLClass, class Alloc> int32 Oscl_Linked_List< LLClass, Alloc >::remove_element (const LLClass & *data_to_remove*) [inline]

Removes the element from the list.

Parameters:

ele return the value of next element of list in this parameter

Returns:

32-bit interger ,if next element is found in list,it returns 1 otherwise it returns 0

**7.54.3.10 OSCL_IMPORT_REF int32 Oscl_Linked_List_Base::insert_element (const OsclAny *
new_element, int index) [protected]**

Inserts new element in the list. If the index is past the end of the list it creates the list and add the element as first element of list.

Parameters:

new_element the element to be add in the list.

Returns:

32-bit integer on the success returns 1.

**7.54.3.11 OSCL_IMPORT_REF int32 Oscl_Linked_List_Base::move_to_end (const OsclAny *
data_to_move) [protected]**

Moves the element to end of the list

Parameters:

data_to_move

Returns:

On success returns 1 otherwise returns 0.

**7.54.3.12 OSCL_IMPORT_REF int32 Oscl_Linked_List_Base::move_to_front (const OsclAny *

7.55.1 Detailed Description

template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> class Oscl_Map< Key, T, Alloc, Compare >

Oscl_Map Class. A subset of STL::Map methods. Oscl_Map is a sorted associative container that associates objects of type Key with objects of type T. It is also a unique associative container, meaning that no two elements have the same key. Oscl_Map uses the key to speed lookup, insertion, and deletion of elements. It is often superior to all other containers when you need to lookup an element by key value. Due to the underlying tree structure, inserts and erases can be performed in logarithmic time, where a vector would take linear time in some cases.

7.55.4.1 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> const_iterator Oscl_Map< Key, T, Alloc, Compare >::begin () const [inline]

Returns a const iterator pointing to the beginning of the map

7.55.4.2 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> iterator Oscl_Map< Key, T, Alloc, Compare >::begin () [inline]

Returns an iterator pointing to the beginning of the map

7.55.4.3 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> void Oscl_Map< Key, T, Alloc, Compare >::clear () [inline]

Erases all elements

7.55.4.4 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> size_type Oscl_Map< Key, T, Alloc, Compare >::count (const **key_type & *x*) const [inline]**

Returns the number of elements with key *x*. For map this will either be 0 or 1.

7.55.4.5 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> bool Oscl_Map< Key, T, Alloc, Compare >::empty () const [inline]

Returns true if map size is 0

7.55.4.6 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> const_iterator Oscl_Map< Key, T, Alloc, Compare >::end () const [inline]

Returns a const iterator pointing to the end of the map.

7.55.4.7 template<class Key, class T, class Alloc, class Compare = Oscl_Less<Key>> iterator Oscl_Map< Key, T, Alloc, Compare >::end () [inline]

Returns an iterator pointing to the end of the map.

7.57.3.1 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::add_element (LLClass & *new_element*) [inline]

Adds new element to the Multi Threaded Linked list.if list is already there then it adds element at end of list otherwise it create the list and add the element as first element of list.

Parameters:

new_element the element to be add in the list.

Returns:

32-bit integer on the success returns 1.

7.57.3.2 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::add_to_front (LLClass & *new_element*) [inline]

Adds new element at the start of the Multi Threaded Linked list. if list is already exist then it adds element at start of list otherwise it create the list and add the element as first element of list.

Parameters:

new_element the element to be add in the list.

Returns:

32-bit integer on the success returns 1.

7.57.3.3 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::dequeue_element (LLClass & *element*) [inline]

7.57.3.4 template<class LLClass, class Alloc, class TheLock> uint32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::get_element (int32 *index*, LLClass & *element*) [inline]

Search and returns the element in the Multi Threaded Linked List for passed index.

Parameters:

index, element The index is the count for the node.

Returns:

32-bit integer on success returns 1 otherwise returns 0.

7.57.3.5 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::get_index (const LLClass & *data*) [inline]

Returns the index for requested element.

Parameters:

data the element for which index to be return.

Returns:

32-bit integer if data is found in the list it returns index otherwise it returns -1.

7.57.3.6 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::move_to_end (const LLClass & *data_to_move*) [inline]

Moves the element to end of the list

Parameters:

data_to_move

Returns:

On success returns 1 otherwise returns 0.

7.57.3.7 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::move_to_front (const LLClass & *data_to_move*) [inline]

Parameters:

data_to_move

Returns:

On success returns 1 otherwise returns 0.

7.57.3.8 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::remove_element (const int32 *index_to_remove*) [inline]

Removes the element for requested index.

Parameters:

index_to_remove

Returns:

on success return 1 otherwise return 0.

7.57.3.9 template<class LLClass, class Alloc, class TheLock> int32 Oscl_MTLinked_List< LLClass, Alloc, TheLock >::remove_element (const LLClass & *data_to_remove*) [inline]

Removes the element from the list.

Parameters:

data_to_remove

Returns:

32-bit integer on if element fount in the list returns 1 otherwise returns 0.

7.62.1 Detailed Description

template<class T, class Alloc> class Oscl_Queue< T, Alloc >

Oscl_Queue Class. A subset of STL::Queue methods. Oscl_Queue supports constant time insertion (at the end) and removal of elements at the front of the queue. It does not support insertion or removal of elements at the other ends or middle of the queue, nor random access to elements. * No iteration capability is [currently] supplied. * No assignment or copy capability is [currently] supplied. The number of elements in a queue can vary dynamically, and memory management is performed automatically.

- 7.62.3.1 **template<class T, class Alloc> Oscl_Queue< T, Alloc >::Oscl_Queue () [inline]**

Creates an empty queue.

- 7.62.3.2 **template<class T, class Alloc> Oscl_Queue< T, Alloc >::Oscl_Queue (uint32 n) [inline]**

Creates an empty queue with capacity n.

Parameters:

n creates a queue with n elements. The main reason for specifying n is efficiency. If you know the capacity to which your queue must grow, then it is more efficient to allocate the queue all at once rather than rely on the automatic reallocation scheme.

- 7.62.3.3 **template<class T, class Alloc> virtual Oscl_Queue< T, Alloc >::~Oscl_Queue () [inline, virtual]**

Reimplemented from [Oscl_Queue_Base](#).

7.62.4.6 template<class T, class Alloc> void Oscl_Queue< T, Alloc >::pop () [inline]

Removes the first element

Reimplemented from [Oscl_Queue_Base](#).

7.62.4.7 template<class T, class Alloc> void Oscl_Queue< T, Alloc >::push (const T & x) [inline]

Inserts a new element at the end. Queue will be grown if necessary. If allocation fails, an OSCL_LEAVE will occur

Parameters:

x new element

7.63.1 Detailed Description

`Oscl_Queue_Base` is a non-templatized base class for [Oscl_Queue](#). The purpose of this base class is to avoid large inline routines in the [Oscl_Queue](#) implementation. This class is not intended for direct instantiation except by [Oscl_Queue](#).

7.63.2 Constructor & Destructor Documentation

7.63.3.6 **bool Oscl_Queue_Base::empty () const [inline]**

True if there are no elements in the queue

7.63.3.7 **OSCL_IMPORT_REF void Oscl_Queue_Base::pop () [protected]**

Removes the first element

Reimplemented in [Oscl_Queue< T, Alloc >](#).

7.63.3.8 **OSCL_IMPORT_REF void Oscl_Queue_Base::push (const OsclAny * x) [protected]**

Inserts a new element at the end. Queue will be grown if necessary. If allocation fails, an OSCL_LEAVE will occur

Parameters:

x new element

7.63.3.9 **OSCL_IMPORT_REF void Oscl_Queue_Base::reserve (uint32 n)**

Reallocates memory if necessary to a capacity of *n* elements. The main reason for reserve is efficiency. If you know the capacity to which your vector must grow, then it is more efficient to allocate the vector all at once rather than rely on the automatic reallocation scheme. This also helps control the invalidation of iterators.

Parameters:

n size of vector

7.63.3.10 uint32 Oscl_Queue_Base::size () const [inline]

Returns the size of the queue.

7.71.1 Detailed Description

template<uint32 MaxBufSize> class OSCL_StackString< MaxBufSize >

OSCL_StackString is a simple string class, compatible with regular character array strings.

The string array is fixed length, is allocated from the stack, and is modifiable. Operations that update the string will automatically truncate it to fit the fixed size storage. This is recommended for use for short strings (<255). Use [OSCL_HeapString](#) for very large strings to avoid stack overflow.

Parameters:

C: type of character.

MaxBufSize: maximum string length not including null terminator.

7.73.4.1 `virtual void OSCL_String::append_rep (const OSCL_String & src) [protected, pure virtual]`

Append the input string to the current string. The string may be truncated to fit the available storage.

7.73.4.2 `virtual void OSCL_String::append_rep (const chartype * cstr) [protected, pure virtual]`

Append the input null-terminated string to the current string. The string may be truncated to fit the available storage.

7.73.4.3 `virtual const chartype* OSCL_String::get_cstr () [pure virtual]`

This function returns the C-style string for read access.

Implemented in [OSCL_HeapString< Alloc >](#), [OSCL_HeapStringA](#), [OSCL_StackString< MaxBufSize >](#), [OSCL_FastString](#), and [OSCL_HeapString< OsclMemAllocator >](#).

7.73.4.4 virtual uint32 OSCL_String::get_maxsize () [pure virtual]

This function returns the maximum available storage size, not including null terminator. The maximum size may be larger than the current string size.

Implemented in [OSCL_HeapString< Alloc >](#), [OSCL_HeapStringA](#), [OSCL_StackString< MaxBufSize >](#), [OSCL_FastString](#), and [OSCL_HeapString< OsclMemAllocator >](#).

7.73.4.5 virtual uint32 OSCL_String::get_size () [pure virtual]

7.73.4.6 virtual chartype* OSCL_String::get_str () [pure virtual]

This function returns the C-style string for write access. If the string is not writable it returns NULL.

Implemented in [OSCL_HeapString< Alloc >](#), [OSCL_HeapStringA](#), [OSCL_StackString< MaxBufSize >](#), [OSCL_FastString](#), and [OSCL_HeapString< OsclMemAllocator >](#).

7.73.4.7 virtual int8 OSCL_String::hash () [virtual]

This function performs a hash operation on the string. If the string is not writable, the function leaves.

7.73.4.8 virtual bool OSCL_String::is_writable () [virtual]

This function returns true if the string is writable.

7.73.4.9 bool OSCL_String::operator!= (const OSCL_String & src) const**7.73.4.10 OSCL_String& OSCL_String::operator+= (const chartype c)**

Append operator. This operator appends the input character to this object. The string may be truncated to fit available storage.

7.73.4.11 OSCL_String& OSCL_String::operator+= (const chartype * cstr)

Append operator. This operator appends the input string to this object. The string may be truncated to fit available storage.

am: null-terminated string

7.73.4.12 OSCL_String& OSCL_String::operator+= (const OSCL_String & src)

7.73.4.21]

chartype OSCL_String::operator[] (uint32 index) const

This is subscript notation to access a character at the given position. If the index is outside the current size range then the function leaves.

7.73.4.22 virtual chartype OSCL_String::read (uint32 index) const [virtual]

This function returns the character at the given position. If the index is outside the current size range then the function leaves.

7.73.4.23 virtual void OSCL_String::set_len (uint32 len) [protected, pure virtual]

Update the length of the string. This function will only be called when the string is writable.

7.73.4.24 virtual void OSCL_String::set_rep (const OSCL_String & src) [protected, pure virtual]

Set string representation to input string.

7.73.4.25 virtual void OSCL_String::set_rep (const chartype * cstr) [protected, pure virtual]

Set string representation to input null-terminated string.

7.73.4.26 virtual uint32 OSCL_String::setrep_to_char (const oscl_wchar * src, uint32 len, TOSCL_StringOp op, Oscl_DefAlloc * aAlloc) [virtual]

This function allocates a temp storage for performing one of the following operations based on TOSCL_StringOp

- compress src string from oscl_wchar to utf8.
- convert src string from oscl_wchar to utf8. call parent [set_rep\(\)](#) to copy resulting string.

Parameters:

src: reference input string

len: length of string to operate on

op: type operation mentioned above

aAlloc: optional, memory allocator if available

Returns:

length of compressed or converted string exclude terminated '\0'.

7.73.4.27 virtual void OSCL_String::write (uint32 offset, uint32 length, const chartype * buf) [virtual]

This function replaces characters at the specified offset within the current string. If the string is not writable, the function leaves. The characters may be truncated to fit the current storage.

Parameters:

offset: the offset into the existing string buffer

length: number of characters to copy.

ptr: character buffer, not necessarily null-terminated.

7.73.4.28 virtual void OSCL_String::write (uint32 index, chartype c) [virtual]

This function stores a character at the specified position. If the string is not writable, the function leaves. If the index is outside the current size range then the function leaves.

Returns an iterator pointing to the first node in the tree.

7.76.4.2 template<class T, class Alloc> iterator Oscl_TagTree< T, Alloc >::begin () [inline]

Returns an iterator pointing to the first node in the tree.

7.76.4.3 template<class T, class Alloc> void Oscl_TagTree< T, Alloc >::clear () [inline]

Erases the entire tag tree.

7.76.4.4 template<class T, class Alloc> size_type Oscl_TagTree< T, Alloc >::count (const tag_base_type & x) const [inline]

Returns the number of elements with key x. This can only be 0 or 1..

7.76.4.5 template<class T, class Alloc> bool Oscl_TagTree< T, Alloc >::empty () const [inline]

Returns true if tree size is 0

7.76.4.6 template<class T, class Alloc> const_iterator Oscl_TagTree< T, Alloc >::end () const [inline]

Returns a const iterator pointing to the end of the tree.

7.76.4.7 template<class T, class Alloc> iterator Oscl_TagTree< T, Alloc >::end () [inline]

Returns an iterator pointing to the end of the tree.

7.76.4.8 template<class T, class Alloc> size_type Oscl_TagTree< T, Alloc >::erase (const tag_base_type & x) [inline]

Erases the node with tag x. If the node has children, then the node will not be erased from the tree. It will be replaced with the default node value

Parameters:

x Tag of node to erase

Returns:

Returns the number of nodes erased. Since one-to-one mapping between nodes and tags, this will be either 0 or 1

7.76.4.9 template<class T, class Alloc> void Oscl_TagTree< T, Alloc >::erase (iterator position) [inline]

Erases the element pointed to by the iterator. If the node has children, then the node will not be erased from the tree. It will be replaced with the default node value.

Parameters:

position Iterator pointing to the node to be erased

7.76.4.10 template<class T, class Alloc> iterator Oscl_TagTree< T, Alloc >::find (const tag_base_type & x) [inline]

Finds an element whose key is x

Returns:

returns an iterator to the element with key x. If no element is found, returns [end\(\)](#)

7.76.4.11 template<class T, class Alloc> pair_iterator_bool Oscl_TagTree< T, Alloc >::insert (const tag_base_type & t, const T & x) [inline]

Inserts x into the tree and associates it with tag t. If the tag already exists x will not be inserted, and an iterator pointing to the existing node with tag t is returned.

Parameters:

t tag to use

x element to insert

Returns:

Returns a pair of parameters, iterator and bool. The iterator points to the inserted node containing x. If the tag t already existed, then the iterator points to the node associated with tag t. The bool is true if x was inserted and false if it was not inserted due to an existing node with tag t.

7.76.4.12 template<class T, class Alloc> Oscl_TagTree<T, Alloc>& Oscl_TagTree< T, Alloc >::operator= (const Oscl_TagTree< T, Alloc > & x) [inline]

Assignment operator

7.76.4.13]

template<class T, class Alloc> T& Oscl_TagTree< T, Alloc >::operator[] (const tag_base_type & t) [inline]

Returns a reference to the object that is associated with a particular tag. If the map does not already contain such an object, operator[] inserts the default object T().

7.76.4.14 template<class T, class Alloc> size_type Oscl_TagTree< T, Alloc >::size () const [inline]

Returns the number of nodes stored in the tree

7.82.1 Detailed Description

template<class T, class Alloc> class Oscl_Vector< T, Alloc >

Oscl_Vector Class. A subset of STL::Vector methods. Oscl_Vector supports random access to elements, constant time insertion and removal of elements at the end of the vector, and linear time insertion and removal of elements at the beginning or middle of the vector. The number of elements in a vector can vary dynamically, and memory management is performed automatically.

7.82.3 Constructor & Destructor Documentation

7.82.3.1 template<class T, class Alloc> Oscl_Vector< T, Alloc >::Oscl_Vector () [inline]

Creates an empty vector.

7.82.3.2 template<class T, class Alloc> Oscl_Vector< T, Alloc >::Oscl_Vector (uint32 n) [inline]

Creates an empty vector with capacity n.

Parameters:

n creates a vector with n elements. The main reason for specifying n is efficiency. If you know the capacity to which your vector must grow, then it is more efficient to allocate the vector all at once rather than rely on the automatic reallocation scheme. This also helps control the invalidation of iterators.

7.82.3.3 template<class T, class Alloc> Oscl_Vector< T, Alloc >::Oscl_Vector (const Oscl_Vector< T, Alloc > & x) [inline]

Copy Constructor.

Parameters:

x vector class to copy.

**7.82.3.4 template<class T, class Alloc> virtual Oscl_Vector< T, Alloc >::~Oscl_Vector ()

Reimplemented from [Oscl_Vector_Base](#).

**7.82.4.7 template<class T, class Alloc> iterator Oscl_Vector< T, Alloc >::erase (iterator *first*,
iterator *last*) [inline]**

Erases elements in range [*first*, *last*). Erasing an element invalidates all iterators pointing to elements following the deletion point.

Parameters:

first starting position

last ending position, this position is not erased

7.82.4.8 template<class T, class Alloc> iterator Oscl_Vector< T, Alloc >::erase (iterator pos) [inline]

Erases the element pointed to by iterator pos. Erasing an element invalidates all iterators pointing to elements following the deletion point.

Parameters:

pos iterator at erase position

7.82.4.9 template<class T, class Alloc> const T& Oscl_Vector< T, Alloc >::front () const [inline]

Returns the first element.

7.82.4.10 template<class T, class Alloc> T& Oscl_Vector< T, Alloc >::front () [inline]

Returns the first element.

7.82.4.11 template<class T, class Alloc> iterator Oscl_Vector< T, Alloc >::insert (iterator pos, const T & x) [inline]

Inserts a new element before the one at pos.

Parameters:

pos position at which to insert the new element.

x new element

7.82.4.12 template<class T, class Alloc> Oscl_Vector<T, Alloc>& Oscl_Vector< T, Alloc >::operator= (const Oscl_Vector< T, Alloc > & x) [inline]

7.82.4.13]

template<class T, class Alloc> const T& Oscl_Vector< T, Alloc >::operator[] (uint32 n) const [inline]

Returns the n'th element.

Parameters:

n element position to return

7.82.4.14]

template<class T, class Alloc> T& Oscl_Vector< T, Alloc >::operator[] (uint32 n) [inline]

Returns the n'th element.

Parameters:

n element position to return

7.82.4.15 template<class T, class Alloc> void Oscl_Vector< T, Alloc >::pop_back () [inline]

Removes the last element.

Reimplemented from [Oscl_Vector_Base](#).

7.82.4.16 template<class T, class Alloc> void Oscl_Vector< T, Alloc >::push_back (const T & x) [inline]

Inserts a new element at the end. Inserting an element invalidates all iterators if memory reallocation occurs as a result of the insertion.

Parameters:

x new element

7.82.4.17 template<class T, class Alloc> void Oscl_Vector< T, Alloc >::push_front (const T & x) [inline]

Inserts a new element at the front. Inserting an element invalidates all iterators if memory reallocation occurs as a result of the insertion.

Parameters:

x new element

7.91.1 Detailed Description

User base class for execution objects. OsclActiveObject defines an execution object without any timer. This AO can be used across threads, i.e. the request can be activated in one thread and completed in another.

7.91.2 Member Enumeration Documentation

7.91.2.1 enum OsclActiveObject::OsclActivePriority

Scheduling priorities.

Enumeration values:

- EPriorityIdle** A low priority, useful for execution objects representing background processing.
EPriorityLow A priority higher than EPriorityIdle but lower than EPriorityNominal.
EPriorityNominal Most exec objects will have this priority.
EPriorityHigh A priority higher than EPriorityNominal; useful for execution objects handling user input.
EPriorityHighest A priority higher than EPriorityHighest.

7.91.3 Constructor & Destructor Documentation

7.91.3.1 OSCL_IMPORT_REF OsclActiveObject::OsclActiveObject (int32 *aPriority*, const char *name*[])

Constructor.

Parameters:

- aPriority* (input param): scheduling priority
name (input param): optional name for this AO.

7.91.3.2 virtual OSCL_IMPORT_REF OsclActiveObject::~OsclActiveObject () [virtual]

Destructor.

7.91.4 Member Function Documentation

7.91.4.1 OSCL_IMPORT_REF void OsclActiveObject::AddToScheduler ()

Add this exec object to the current thread's scheduler.

Reimplemented from [PVActiveBase](#).

7.91.4.2 OSCL_IMPORT_REF void OsclActiveObject::Cancel ()

Cancel any pending request. If the request is readied, this will call the DoCancel routine, wait for the request to cancel, then set the request idle. The AO will not run. If the request is not readied, it does nothing. Request must be canceled from the same thread in which it is scheduled.

Reimplemented from [PVActiveBase](#).

7.91.4.3 virtual OSCL_IMPORT_REF void OsclActiveObject::DoCancel () [protected, virtual]

Cancel request handler. This gets called by scheduler when the request is cancelled. The default routine will complete the request. If any additional action is needed, the derived class may override this. If the derived class does override DoCancel, it must complete the request.

Implements [PVActiveBase](#).

Reimplemented in [OsclDNSRequestAO](#), and [OsclSocketRequestAO](#).

7.91.4.4 OSCL_IMPORT_REF bool OsclActiveObject::IsBusy ()

Return true if this AO is pending, false otherwise.

7.91.4.5 OSCL_IMPORT_REF void OsclActiveObject::PendComplete (int32 *aStatus*)

Complete the active request for the AO. This API is thread-safe. If the request is not pending, this call will leave.

Parameters:

aStatus: request completion status.

7.91.4.6 OSCL_IMPORT_REF void OsclActiveObject::PendForExec ()

Set request active for this AO and set the status to pending. PendForExec is identical to SetActive, but it additionally sets the request status to OSCL_REQUEST_PENDING.

7.91.4.7 OSCL_IMPORT_REF int32 OsclActiveObject::Priority ()

Return scheduling priority of this exec object.

7.91.4.8 OSCL_IMPORT_REF void OsclActiveObject::RemoveFromScheduler ()

Remove this AO from its scheduler. Will leave if the calling thread context does not match the scheduling thread. Cancels any readied request before removing.

Reimplemented from [PVActiveBase](#).

**7.91.4.9 virtual OSCL_IMPORT_REF int32 OsclActiveObject::RunError (int32 *aError*)
[protected, virtual]**

Run Error handler. This gets called by scheduler when the Run routine leaves. The default implementation simply returns the leave code. If the derived class wants to handle errors from Run, it may override this. The RunError should return OsclErrNone if it handles the error, otherwise it should return the input error code.

Parameters:

aError: the leave code generated by the Run.

Implements [PVActiveBase](#).

7.91.4.10 OSCL_IMPORT_REF void OsclActiveObject::RunIfNotReady ()

Complete this AO's request immediately. If the AO is already active, this will do nothing. Will leave if the AO is not added to any scheduler, or if the calling thread context does not match the scheduling thread.

7.91.4.11 OSCL_IMPORT_REF void OsclActiveObject::SetBusy ()

Set object ready for this AO, additionally sets the request status to OSCL_REQUEST_PENDING. Will leave if the request is already readied, or the execution object is not added to any scheduler, or the calling thread context does not match the scheduler thread.

7.91.4.12 OSCL_IMPORT_REF void OsclActiveObject::SetStatus (int32)**7.91.4.13 OSCL_IMPORT_REF int32 OsclActiveObject::Status ()**

7.94.3.5 OsclAsyncFile* OsclAsyncFile::NewL (OsclNativeFile & aSyncFile, int32 aCacheSize, PVLogger *) [static]

Two-phased constructor.

Parameters:

aSyncFile: open handle for async file read. Note: it is the caller's job to open/close this file handle.

aSyncFile: duplicate open handle for sync file read. Note: it is the caller's job to open this file handle, but this class will close the handle.

aCacheSize: size of one of the individual cache buffers. The total cached data size will be larger, since multiple buffers are used.

aStartAsyncRead: When true, async file read will start immediately. When false, read will not begin until StartAsyncRead is called.

This method writes a uint32 from 'data' to the stream.

7.104.3.2 OsclBinOStreamLittleEndian& OsclBinOStreamLittleEndian::operator<< (const int32 & data)

This method writes a int32 from 'data' to the stream.

7.104.3.3 OsclBinOStreamLittleEndian& OsclBinOStreamLittleEndian::operator<< (const uint16 & data)

This method writes a uint16 from 'data' to the stream.

7.104.3.4 OsclBinOStreamLittleEndian& OsclBinOStreamLittleEndian::operator<< (const int16 & data)

This method writes a int16 from 'data' to the stream.

7.104.3.5 OsclBinOStreamLittleEndian& OsclBinOStreamLittleEndian::operator<< (const uint8 & data)

This method writes a uint8 from 'data' to the stream.

7.104.3.6 OsclBinOStreamLittleEndian& OsclBinOStreamLittleEndian::operator<< (const int8 & data)

This method writes a int8 from 'data' to the stream.

7.104.3.7 void OsclBinOStreamLittleEndian::WriteUnsignedLong (const uint32 data) [protected]

This method writes 'data' (unsigned long) to the stream.

7.104.3.8 void OsclBinOStreamLittleEndian::WriteUnsignedShort (const uint16 data) [protected]

This method writes 'data' (unsigned short) to the stream.

7.105.3.1 void OsclBinStream::Attach (const uint32 *numFragments*, const [OsclMemoryFragment](#) **fragPtr*)

This method specifies the memory fragment array to use for input.

This array should remain static while the stream refers to it.

Parameters:

numFragments is the number of elements in the array

fragPtr is the pointer to the MemoryFragment array

7.105.3.2 void OsclBinStream::Attach (void **buffer*, uint32 *l_length*)

This methods specifies the data buffer to attach to the stream.

Parameters:

buffer will provide the input

length of the buffer

7.105.3.3 bool OsclBinStream::eof ()

This method determines if end of stream has been reached.

Returns:

true if end of stream has been reached.

7.105.3.4 bool OsclBinStream::fail ()

This method determines if an error has occurred in the stream.

Returns:

true if an error occurred in the stream.

7.105.3.5 bool OsclBinStream::good ()

This method determines if the stream is ok.

Returns:

true if stream is ok.

7.105.3.6 bool OsclBinStream::HaveRoomInCurrentBlock (uint32 *size*) [protected]**7.105.3.7 uint32 OsclBinStream::PositionInBlock ()**

This method returns the current stream position.

Returns:

stream position.

7.105.3.8 bool OsclBinStream::ReserveSpace (uint32 *size*) [protected]**7.105.3.9 void OsclBinStream::Seek (uint32 *absPosition*)**

This method seeks to the specified stream position.

Returns:

Stream position.

7.105.3.10 void OsclBinStream::seekFromCurrentPosition (int32 *offset*)

This method seeks to the specified offset from the current location.

Parameters:

offset from current stream location

7.105.3.11 uint32 OsclBinStream::tellg ()

This method returns the current stream position.

This method is to be used if the input stream is a pointer to the MemoryFragment array

Returns:

Stream position.

7.114.3.1 OSCL_IMPORT_REF void OsclDNS::CancelGetHostByName ()

Cancel GetHostByName

This method will cancel any pending GetHostByName operation on the current object, causing the GetHostByName to complete with error EPVDNSCancel. If there is no pending GetHostByName operation, this method will have no effect.

7.114.3.2 OSCL_IMPORT_REF TPVDNSEvent OsclDNS::GetHostByName (char * *name*, OsclNetworkAddress & *addr*, int32 *aTimeoutMsec* = -1, Oscl_Vector< OsclNetworkAddress, OsclMemAllocator > * *aAddressList* = NULL)

GetHostByName. This is an asynchronous method.

Parameters:

name: Null-terminated string containing the host name.

addr: The output address corresponding to the host. The ipAddr field will contain the network address of the host in dotted decimal notation.

aTimeoutMsec: A timeout for the request in milliseconds, or (-1) to indicate infinite wait.

aAddressList : A list of addresses for the host. @returns: EPVDNSPending for success, EPVDNSFailure for failure.

7.114.3.3 OSCL_IMPORT_REF OsclDNS* OsclDNS::NewL (Oscl_DefAlloc & *alloc*, OsclSocketServ & *aServ*, OsclDNSObserver & *aObserver*, uint32 *aId*) [static]

DNS object creation.

Parameters:

alloc: Memory allocator

aServ: Socket server.

aObserver: DNS Event observer

aId: Unique ID for this DNS object. This ID will be included in all callbacks associated with this DNS object.

Handles an active object's request completion event.

A derived class must provide an implementation to handle the completed request. If appropriate, it may issue another request.

The function is called by the active scheduler when a request completion event occurs, i.e. after the active scheduler's `WaitForAnyRequest()` function completes.

Before calling this active object's `Run()` function, the active scheduler has:

1. decided that this is the highest priority active object with a completed request

2. marked this active object's request as complete (i.e. the request is no longer outstanding)

`Run()` runs under a trap harness in the active scheduler. If it leaves, then the active scheduler calls `ExecError()` to handle the leave.

Note that once the active scheduler's `Start()` function has been called, all user code is run under one of the program's active object's `Run()` or `RunError()` functions.

7.130 OsclExclusiveArrayPtr< T > Class Template Reference

The OsclExclusiveArrayPtr class is a template class that defines an array pointer like object intended to be assigned an address obtained (directly or indirectly) by new. When the OsclExclusiveArrayPtr expires, its destructor uses delete to free the memory.

```
#include <oscl_exclusive_ptr.h>
```

Public Methods

- **OsclExclusiveArrayPtr (T *inPtr=0)**
Default constructor Initializes the pointer and takes ownership.
- **OsclExclusiveArrayPtr (OsclExclusiveArrayPtr< T > &_Y)**
Copy constructor.
- **OsclExclusiveArrayPtr< T > & operator= (OsclExclusiveArrayPtr< T > &_Y)**
Assignment operator from an another OsclExclusiveArrayPtr.
- **virtual ~OsclExclusiveArrayPtr ()**
Destructor.
- **T & operator* () const**
The indirection operator () accesses a value indirectly, through a pointer.*
- **T * operator-> () const**
The indirection operator (->) accesses a value indirectly, through a pointer.
- **T * get () const**
get() method returns the pointer, currently owned by the class.
- **T * release ()**
release() method releases ownership of the pointer, currently owned by the class. It returns the pointer as well.
- **bool set (T *ptr)**
set() method sets ownership to the pointer, passed. This method is needed when the class is created with a default constructor. Returns false in case the class is non-empty.

Protected Attributes

- **T * _Ptr**

7.130.1 Detailed Description

template<class T> class OsclExclusiveArrayPtr< T >

The OsclExclusiveArrayPtr class is a template class that defines an array pointer like object intended to be assigned an address obtained (directly or indirectly) by new. When the OsclExclusiveArrayPtr expires, its destructor uses delete to free the memory.

The purpose of this class is to provide a way to prevent accidental memory leaks in a class or a method, due to "not remembering to delete" variables allocated on the heap. Thus if you assign an address returned by new to an [OsclExclusivePtr](#) object, you don't have to remember to free the memory later, it will be freed automatically when the object goes out of scope. The [OsclExclusivePtr](#) is an example of a smart pointer, an object that acts like a pointer, but with additional features. The class is defined so that it acts like a regular pointer in most respects

7.130.3.1 template<class T> T* OsclExclusiveArrayPtr< T >::get () const [inline]

[get\(\)](#) method returns the pointer, currently owned by the class.

7.130.3.2 template<class T> T& OsclExclusiveArrayPtr< T >::operator * () const [inline]

The indirection operator (*) accesses a value indirectly, through a pointer.

This operator ensures that the OsclExclusiveArrayPtr can be used like the regular pointer that it was initialized with.

7.130.3.3 template<class T> T* OsclExclusiveArrayPtr< T >::operator -> () const [inline]

The indirection operator (->) accesses a value indirectly, through a pointer.

This operator ensures that the OsclExclusiveArrayPtr can be used like the regular pointer that it was initialized with.

7.130.3.4 template<class T> OsclExclusiveArrayPtr<T>& OsclExclusiveArrayPtr< T >::operator= (OsclExclusiveArrayPtr< T > & _Y) [inline]

Assignment operator from an another OsclExclusiveArrayPtr.

Parameters:

_Y The value parameter should be another OsclExclusiveArrayPtr

Returns:

Returns a reference to this OsclExclusiveArrayPtr instance with pointer initialized.

Precondition:

The input class should be non-null and should point to a valid pointer.

This assignment operator initializes the class to the contents of the OsclExclusiveArrayPtr given as the input parameter. The ownership of the pointer is transferred.

7.130.3.5 template<class T> T* OsclExclusiveArrayPtr< T >::release () [inline]

[release\(\)](#) method releases ownership of the pointer, currently owned by the class. It returns the pointer as well.

7.130.3.6 template<class T> bool OsclExclusiveArrayPtr< T >::set (T *ptr) [inline]

[set\(\)](#) method sets ownership to the pointer, passed. This method is needed when the class is created with a default constructor. Returns false in case the class is non-empty.

7.133.1.3 OSCL_IMPORT_REF void OsclExecScheduler::RunSchedulerNonBlocking (int32 aTargetCount, int32 & aReady, uint32 & aDelayMsec)

Run PV scheduler in non-blocking mode. This call returns when the desired number of Run calls have been made, or when there are no more active objects that are ready to run.

Parameters:

aTargetCount: (input param) the maximum number of Run calls to make.

aReady: (output param) tells the number of active objects that are currently ready to run.

aDelayMsec: (output param) If no active objects are ready to run, but one or more active objects are waiting on timers, this parameter will tell the time interval from the current time until the first of the pending timer objects will be ready to run, in milliseconds.

Note: On Symbian, non-blocking mode is not supported and this call will leave.

OsclExtractFilenameFromFullPath utility function provide the FileName From Path of a file.

Parameters:

in] character path; the full path of the file or directory

out] character FileName :file Name .It is assigned a pointer to file name in path itself.

Returns:

void for all condition

**7.139.2.3 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileAttributes (const char *

OsclGetFileAttributes utility function provides the various attributes of file (or directory) like if it is hidden, read only etc. The uint32 value is to be interpreted as per the enum OSCL_FILE_ATTRIBUTE_TYPE defined in [oscl_file_manager.h](#)

Parameters:

in] character path; the full path of the file or directory

out] file attributes.

Returns:

true if successful, otherwise false.

**7.139.2.4 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileAttributes (const oscl_wchar

OsclGetFileAttributes utility function provides the various attributes of file (or directory) like if it is hidden, read only etc. The uint32 value is to be interpreted as per the enum OSCL_FILE_ATTRIBUTE_TYPE defined in [oscl_file_manager.h](#)

Parameters:

in] wide character path; the full path of the file or directory

out] file attributes.

Returns:

true if successful, otherwise false.

**7.139.2.5 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileCreationTime (const char *
aFileName, uint64 & aFileCreationTime) [static]**

OsclGetFileCreationTime utility function provides the file (or directory) creation time

Note:

On symbian platform, this api returns last modified time.

Parameters:

in] character path; the full path of the file or directory

out] creation time in microseconds.

Returns:

true if successful, otherwise false.

**7.139.2.6 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileCreationTime (const

Parameters:

in] wide character path; the full path of the file or directory

out] creation time in microseconds

Returns:

true if successful, otherwise false.

**7.139.2.7 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileLastAccessTime (const char
* aFileName, uint64 & aFileLastAccessTime) [static]**

OsclGetFileLastAccessTime utility function provides the file (or directory) last access time, which might be different from last modified time.

Note:

On symbian platform, this api returns last modified time.

Parameters:

in] character path; the full path of the file or directory

out] Last access time in microseconds.

Returns:

true if successful, otherwise false.

7.139.2.8 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileLastAccessTime (const oscl_wchar * aFileName, uint64 & aFileLastAccessTime) [static]

OsclGetFileLastAccessTime utility function provides the file (or directory) last access time, which might be different from last modified time.

Note:

On symbian platform, this api returns last modified time.

Parameters:

in] wide character path; the full path of the file or directory
out] Last access time in microseconds

Returns:

true if successful, otherwise false.

7.139.2.9 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileLastWriteTime (const char * aFileName, uint64 & aFileLastWriteTime) [static]

OsclGetFileLastWriteTime utility function provides the file (or directory) last modified time.

Parameters:

in] character path; the full path of the file or directory
out] last modified time in microseconds

Returns:

true if successful, otherwise false.

7.139.2.10 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileLastWriteTime (const oscl_wchar * aFileName, uint64 & aFileLastWriteTime) [static]

OsclGetFileLastWriteTime utility function provides the file (or directory) last modified time.

Parameters:

in] wide character path; the full path of the file or directory
out] last modified time in microseconds

Returns:

true if successful, otherwise false.

7.139.2.11 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileSize (const char * aFileName, uint64 & aFileSize) [static]

OsclGetFileSize utility function provides the file size. For directory, this value is undefined.

Parameters:

in] character path; the full path of the file or directory
out] file size in bytes.

Returns:

true if successful, otherwise false.

**7.139.2.12 OSCL_IMPORT_REF bool OsclFileManager::OsclGetFileSize (const oscl_wchar *

7.156.1 Detailed Description

```
template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> class OSCLMemAuto-  
Ptr< T, _Allocator >
```

The oscl_auto_ptr class is a template class that defines a pointer like object intended to be assigned an address obtained (directly or indirectly) by new. When the oscl_auto_ptr expires, its destructor uses delete to free the memory.

The purpose of this class is to provide a way to prevent accidental memory leaks in a class or a method, due to "not remembering to delete" variables allocated on the heap. Thus if you assign an address returned by new to an oscl_auto_ptr object, you don't have to remember to free the memory later, it will be freed automatically when the object goes out of scope. The oscl_auto_ptr is an example of a smart pointer, an object that acts like a pointer, but with additional features. The class is defined so that it acts like a regular pointer in most respects

7.156.2 Constructor & Destructor Documentation

```
7.156.2.1 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>>  
OSCLMemAutoPtr< T, _Allocator >::OSCLMemAutoPtr (T * inPtr = 0) [inline,  
explicit]
```

Default constructor Initializes the pointer and takes ownership.

```
7.156.2.2 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>>  
OSCLMemAutoPtr< T, _Allocator >::OSCLMemAutoPtr (const OSCLMemAutoPtr<  
T > & _Y) [inline]
```

Copy constructor.

Initializes the pointer and takes ownership from another oscl_auto_ptr. Note that the other class does NOT own the pointer any longer, and hence it is NOT its responsibility to free it.

```
7.156.2.3 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>>  
OSCLMemAutoPtr< T, _Allocator >::~OSCLMemAutoPtr () [inline]
```

Destructor.

The pointer is deleted in case this class still has ownership

7.156.3 Member Function Documentation

7.156.3.1 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> void OSCLMemAutoPtr< T, _Allocator >::allocate (oscl_memsize_t size) [inline]

7.156.3.2 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> void OSCLMemAutoPtr< T, _Allocator >::deallocate (T *ptr) [inline, static]

7.156.3.3 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> T* OSCLMemAutoPtr< T, _Allocator >::get () const [inline]

[get\(\)](#) method returns the pointer, currently owned by the class.

7.156.3.4 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> T& OSCLMemAutoPtr< T, _Allocator >::operator * () const [inline]

The indirection operator (*) accesses a value indirectly, through a pointer.

This operator ensures that the OSCLMemAutoPtr can be used like the regular pointer that it was initialized with.

7.156.3.5 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> T* OSCLMemAutoPtr< T, _Allocator >::operator -> () const [inline]

The indirection operator (->) accesses a value indirectly, through a pointer.

This operator ensures that the OSCLMemAutoPtr can be used like the regular pointer that it was initialized with.

7.156.3.6 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> OSCLMemAutoPtr< T, _Allocator >& OSCLMemAutoPtr< T, _Allocator >::operator=(const OSCLMemAutoPtr< T, _Allocator > & _Y) [inline]

Assignment operator from an another oscl_auto_ptr.

Parameters:

_Y The value parameter should be another oscl_auto_ptr

Returns:

Returns a reference to this oscl_auto_ptr instance with pointer initialized.

Precondition:

The input class should be non-null and should point to a valid pointer.

This assignment operator initializes the class to the contents of the oscl_auto_ptr given as the input parameter. The ownership of the pointer is transferred.

7.156.3.7 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> T* OSCLMemAutoPtr< T, _Allocator >::release () const [inline]

[release\(\)](#) method releases ownership of the pointer, currently owned by the class. It returns the pointer as well.

7.156.3.8 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> void OSCLMemAutoPtr< T, _Allocator >::setWithoutOwnership (T *ptr) [inline]

The takeOwnership function assigns the value with ownership.

7.156.3.9 template<class T, class _Allocator = Oscl_TAlloc<T, OsclMemAllocator>> void OSCLMemAutoPtr< T, _Allocator >::takeOwnership (T *ptr) [inline]

The takeOwnership function assigns the value with ownership.

7.161.1.1 OSCL_IMPORT_REF OsclMemPoolFixedChunkAllocator::OsclMemPoolFixedChunkAllocator (const uint32 numchunk = 1, const uint32 chunkszie = 0, Oscl_DefAlloc * gen_alloc = NULL, const uint32 chunkalignment = 0)

This API throws an exception when the memory allocation for pool fails If numchunk and chunkszie parameters are not set, memory pool of 1 chunk will be created in the first call to allocate. The chunk size will be set to the n passed in for [allocate\(\)](#). If numchunk parameter is set to 0, the memory pool will use 1 for numchunk. If chunkalignment is set to 0, memory pool will use default allocator alignment (8-byte) If chunkalignment is > 0, memory pool will align all buffers in the mempool to the specified alignment. Alignment should be a power of 2

Returns:

void

7.161.1.2 virtual OsclMemPoolFixedChunkAllocator::~OsclMemPoolFixedChunkAllocator () [inline, virtual]

The destructor for the memory pool

7.161.2 Member Function Documentation

7.161.2.1 OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::addRef ()

Increments the reference count for this memory pool allocator

Returns:

void

7.161.2.2 virtual OSCL_IMPORT_REF OsclAny* OsclMemPoolFixedChunkAllocator::allocate (const uint32 n) [virtual]

This API throws an exception when n is greater than the fixed chunk size or there are no free chunk available in the pool, if "enablenullpointerreturn" has not been called. If the memory pool hasn't been created yet, the pool will be created with chunk size equal to n so n must be greater than 0. Exception will be thrown if memory allocation for the memory pool fails.

Returns:

pointer to available chunk from memory pool

Implements [Oscl_DefAlloc](#).

7.161.2.3 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::CancelFreeChunkAvailableCallback () [virtual]

This API will cancel any past callback requests..

Returns:

7.161.2.4 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::createmempool() [protected, virtual]

**7.161.2.5 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::deallocate(
OsclAny *p)** [virtual]

This API throws an exception when the pointer p passed in is not part of the memory pool. Exception will be thrown if the memory pool is not set up yet.

Returns:

void

Implements [Oscl_DefAlloc](#).

7.161.2.6 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::destroymempool() [protected, virtual]

7.161.2.7 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::enablenullpointerreturn() [virtual]

This API will disable exceptions in case the memory pool runs out of memory Instead of doing "[OSCL_LEAVE\(OsclErrNoResources\)](#)" allocate API will return NULL.

Returns:

void

**7.161.2.8 virtual OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::notifyfreechunkavailable(
OsclMemPoolFixedChunkAllocatorObserver &obs, OsclAny *aContextData = NULL)** [virtual]

This API will set the flag to send a callback via specified observer object when the next memory chunk is deallocated by [deallocate\(\)](#) call..

Returns:

void

7.161.2.9 OSCL_IMPORT_REF void OsclMemPoolFixedChunkAllocator::removeRef()

Decrements the reference count for this memory pool allocator When the reference count goes to 0, this instance of the memory pool object is deleted

Returns:

void

7.163.1 Constructor & Destructor Documentation

7.163.1.1 OSCL_IMPORT_REF OsclMemPoolResizableAllocator::OsclMemPoolResizableAllocator (uint32 *aMemPoolBufferSize*, uint32 *aMemPoolBufferNumLimit* = 0, uint32 *aExpectedNumBlocksPerBuffer* = 0, `Oscl_DefAlloc * gen_alloc` = NULL)

Create the memory pool allocator with resizing functionality. The size of the memory pool buffer needs to be passed-in. The maximum number of memory pool buffers, expected number of blocks in a memory pool buffer, and outside allocator are optional. This API throws an exception when the memory allocation for the pool buffer fails. If memory pool buffer number limit parameter is not set, the assumption is that there is no limit and memory pool will grow as needed. If the expected number of blocks is not set or not known, the memory pool will use a default value to 10 to allocate extra memory for the block info header.

Returns:

`void`

7.163.1.2 virtual OsclMemPoolResizableAllocator::~OsclMemPoolResizableAllocator () [inline, protected, virtual]

The destructor for the memory pool. Should not be called directly. Use `removeRef()` instead.

7.163.2 Member Function Documentation

Returns:

void

**7.163.2.3 virtual OSCL_IMPORT_REF [OsclAny](#)* OsclMemPoolResizableAllocator::allocate
(const uint32 aNumBytes) [virtual]**

Allocates a block from the memory pool that is at least in size requested This API throws an exception if there isn't enough memory (if "enablenullpointerreturn" has not been called) for the requested amount in the pool or if the extra pool buffer cannot be allocated.

Returns:

This API will set the flag to send a callback via specified observer object when the next memory block is deallocated by [deallocate\(\)](#) call. If the optional requested size parameter is set, the callback is sent when a free memory space of requested size becomes available. The optional context data is returned with the callback and can be used by the user to differentiate between different instances of memory pool objects. This memory pool only allows one notify to be queued. Another call to this function will just overwrite the previous call.

Returns:

void

7.163.2.20 `virtual OSCL_IMPORT_REF void OsclMemPoolResizableAllocator::notifyfreememoryavailable (OsclMemPoolResizableAllocatorMemoryObserver & aObserver, uint32 aRequestedSize = 0, OsclAny * aContextData = NULL)`
[virtual]

7.163.2.21 `OSCL_IMPORT_REF void OsclMemPoolResizableAllocator::removeRef ()`

Decrements the reference count for this memory pool allocator When the reference count goes to 0, this instance of the memory pool object is deleted

Returns:

`void`

7.163.2.22 `virtual OSCL_IMPORT_REF bool OsclMemPoolResizableAllocator::setMaxSzForNewMemPoolBuffer (uint32 aMaxNewMemPoolBufferSz)`
[virtual]

7.163.2.23 `virtual OSCL_IMPORT_REF bool OsclMemPoolResizableAllocator::trim (OsclAny * aPtr, uint32 aBytesToFree)` [virtual]

Returns a tail segment of a previously allocated memory block back to the memory pool. The passed-in pointer to the memory buffer is still valid after the call completes but the buffer size is smaller by by specified amount that was freed. This function allows the user to allocate a larger size block initially when the amount needed is unknown and then return the unused portion of the block when the amount becomes known. This API throws an exception if the pointer passed in is not part of the memory pool or the size to return is bigger than the size of the passed-in block. Exception will be thrown if the memory pool is not set up yet.

Returns:

`bool` True if trim operation successful. False if the block wasn't trimmed

It wont take any parameters

Returns:

Returns SUCCESS_ERROR if the mutex was acquired, MUTEX_LOCKED_ERROR if the mutex cannot be acquired without waiting, or an error code if the operation failed. Note: this function may not be supported on all platforms, and may return NOT_IMPLEMENTED.

7.169.3.5 OSCL_IMPORT_REF void OsclMutex::Unlock () [virtual]

Releases the Mutex

Parameters:

It wont take any parameters

Returns:

Returns nothing

```
template<int __len> class OsclNameString< __len >
```

Name string class appropriate for passing short constant ASCII strings around. All strings are automatically truncated and null-terminated.

7.191.1 Detailed Description

Implementation of an [OsclRefCounter](#) that uses a dynamically created deallocator.

7.191.2 Constructor & Destructor Documentation

7.191.2.1 OsclRefCounterDA::OsclRefCounterDA ([OsclAny *p](#), [OsclDestructDealloc *dealloc](#)) [inline]

Constructor Takes a pointer to the buffer to track, and a pointer to the deallocator object which will be used to delete the buffer.

When the reference count reaches zero, the buffer will be deleted by the deallocator. Also, the [OsclRefCounter](#) object (this) will self-destruct when the reference count is zero. In some cases the [OsclRefCounter](#) object will be part of the buffer being deleted. For such cases, the object pointer must be equal to the buffer pointer given at construction. If the object is not part of the buffer being deleted, it will self-destruct with a call to `delete()`.

Parameters:

p pointer to the buffer to track

dealloc pointer to the deallocator to use when deleting the buffer

7.191.2.2 virtual OsclRefCounterDA::~OsclRefCounterDA () [inline, virtual]

Destructor empty

7.191.3 Member Function Documentation

7.192.2.1 OsclRefCounterMemFrag::OsclRefCounterMemFrag ([OsclMemoryFragment & m](#), [OsclRefCounter * r](#), [uint32 in_capacity](#)) [inline]

Constructor. A valid memory fragment and reference counter are required as input. The memory fragment structure will be copied locally.

Parameters:

- m* reference to memory fragment
- r* pointer to the reference counter associated with the memory fragment.

7.192.2.2 OsclRefCounterMemFrag::OsclRefCounterMemFrag ([const OsclRefCounterMemFrag & x](#)) [inline]

Copy constructor.

7.192.2.3 OsclRefCounterMemFrag::OsclRefCounterMemFrag () [inline]

Default constructor.

7.192.2.4 OsclRefCounterMemFrag::~OsclRefCounterMemFrag () [inline]

Destructor. Removes this object's reference from the reference counter. The reference counter will not be deleted. The reference counter is designed to self-delete when it's reference count reaches 0.

7.192.3 Member Function Documentation

7.192.3.1 **uint32 OsclRefCounterMemFrag::getCapacity () [inline]**

Returns the capacity of the memory fragment

Returns:

7.192.3.2 **uint32 OsclRefCounterMemFrag::getCount () [inline]**

Returns the reference counter's current count.

7.205.1 Detailed Description

OsclSchedulerObserver is an observer class for use when running scheduler in non-blocking mode. The scheduler observer can register for callbacks so it will be notified when it is necessary to run scheduler again. Note: non-blocking mode and scheduler callbacks are not supported on Symbian.

7.205.2 Constructor & Destructor Documentation

7.205.3 Member Function Documentation

7.205.3.1 virtual void [OsclSchedulerObserver::OsclSchedulerReadyCallback](#) ([OsclAny](#) **aContext*) [pure virtual]

[OsclSchedulerReadyCallback](#) is called when the ready queue is updated, meaning an AO is ready to run. Scheduler needs to be run ASAP. Calling context may be any thread, so be careful!

The current observer is cleared before making the callback, so the observer must call RegisterForCallback again if it wants further notifications.

7.205.3.2 virtual void [OsclSchedulerObserver::OsclSchedulerTimerCallback](#) ([OsclAny](#) **aContext*, uint32 *aDelayMsec*) [pure virtual]

[OsclSchedulerTimerCallback](#) is called when the front of the timer queue is updated. This means the minimum delay has changed and scheduler needs to be run again after *aDelayMsec*. Calling context is in-thread.

The current observer is cleared before making the callback, so the observer must call RegisterForCallback again if it wants further notifications.

7.206.1 Detailed Description

template<class LockClass> class OsclScopedLock< LockClass >

The OsclScopedLock class is a template class that handles unlocking an abstract class on destruction. This is very useful for ensuring that the lock is released when the OsclScopedLock goes out of scope.

The purpose of this class is to provide a way to prevent accidental resource leaks in a class or a method, due to "not remembering to unlock" variables which might lead to deadlock conditions.

7.206.2 Constructor & Destructor Documentation

7.206.2.1 **template<class LockClass> OsclScopedLock< LockClass >::OsclScopedLock (LockClass & inLock) [inline, explicit]**

Default constructor Initializes the pointer and takes ownership.

7.206.2.2 **template<class LockClass> OsclScopedLock< LockClass >::~OsclScopedLock () [inline]**

Destructor.

The pointer is deleted in case this class still has ownership

7.208.3.4 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclSemaphore::TryWait ()

Try to acquire semaphore ,if the semaphore is already acquired by another thread, calling thread immediately returns with out blocking

Parameters:

It wont take any parameters

Returns:

Returns SUCCESS_ERROR if the semaphore was acquired, SEM_LOCKED_ERROR if the semaphore cannot be acquired without waiting, or an error code if the operation failed. Note: this function may not be supported on all platforms, and may return NOT_IMPLEMENTED.

7.208.3.5 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclSemaphore::Wait (uint32 timeout_msec)

Makes the thread to wait on the Semaphore, with a timeout.

Parameters:

timeout in milliseconds.

Returns:

Returns SUCCESS_ERROR if the semaphore was aquired, WAIT_TIMEOUT_ERROR if the timeout expired without acquiring the semaphore, or an error code if the operation failed. Note: this function may not be supported on all platforms, and may return NOT_IMPLEMENTED.

7.208.3.6 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclSemaphore::Wait ()

7.216.2.1 template<class T, uint32 ID, class Registry = OsclSingletonRegistry> T& OsclSingleton< T, ID, Registry >::operator * () const [inline]

The indirection operator (*) accesses a value indirectly, through a pointer.

This operator ensures that the OsclSingleton can be used like the regular pointer that it was initialized with.

7.216.2.2 template<class T, uint32 ID, class Registry = OsclSingletonRegistry> T* OsclSingleton< T, ID, Registry >::operator → () const [inline]

The indirection operator (->) accesses a value indirectly, through a pointer.

This operator ensures that the OsclSingleton can be used like the regular pointer that it was initialized with.

**7.216.2.3 template<class T, uint32 ID, class Registry = OsclSingletonRegistry> bool
OsclSingleton< T, ID, Registry >::set () [inline]**

[set\(\)](#) method sets ownership to the pointer, passed. This method is needed when the class is created with a default constructor. Returns false in case the class is non-empty.

7.220.1 Detailed Description

OsclSocketMethod is the base class for all socket methods. Two AOs are required for each socket operation— one to provide a timeout, and one to detect request completion. The OsclSocketMethod class implements the timeout and contains the request completion AO.

7.220.3.7 void OsclSocketMethod::Run () [protected, virtual]

Handles an active object's request completion event.

A derived class must provide an implementation to handle the completed request. If appropriate, it may issue another request.

The function is called by the active scheduler when a request completion event occurs, i.e. after the active scheduler's `WaitForAnyRequest()` function completes.

Before calling this active object's `Run()` function, the active scheduler has:

1. decided that this is the highest priority active object with a completed request

2. marked this active object's request as complete (i.e. the request is no longer outstanding)

[Run\(\)](#) runs under a trap harness in the active scheduler. If it leaves, then the active scheduler calls [ExecError\(\)](#) to handle the leave.

Note that once the active scheduler's Start() function has been called, all user code is run under one of the program's active object's [Run\(\)](#) or [RunError\(\)](#) functions.

Implements [PVActiveBase](#).

Socket Event callback.

Parameters:

aId: The ID that was supplied when the socket was created.

aFxn: Type of socket function call.

aEvent: Function completion event. Will be EPVSocketSuccess, EPVSocketTimeout, or EPVSocketFailure.

aError: When the event is EPVSocketFailure, this may contain a platform-specific error code, or zero if none is available.

7.223.3.4 void OsclSocketRequestAO::ConstructL () [inline]

7.223.3.5 void OsclSocketRequestAO::DoCancel () [inline, protected, virtual]

Cancel request handler. This gets called by scheduler when the request is cancelled. The default routine will complete the request. If any additional action is needed, the derived class may override this. If the derived class does override DoCancel, it must complete the request.

Reimplemented from [OsclActiveObject](#).

7.223.3.9 void OsclSocketRequestAO::RequestDone () [inline, protected]

7.223.3.10 void OsclSocketRequestAO::Run () [protected, virtual]

Handles an active object's request completion event.

A derived class must provide an implementation to handle the completed request. If appropriate, it may issue another request.

The function is called by the active scheduler when a request completion event occurs, i.e. after the active scheduler's WaitForAnyRequest() function completes.

Before calling this active object's Run() function, the active scheduler has:

1. decided that this is the highest priority active object with a completed request
2. marked this active object's request as complete (i.e. the request is no longer outstanding)

Run() runs under a trap harness in the active scheduler. If it leaves, then the active scheduler calls ExecError() to handle the leave.

Note that once the active scheduler's Start() function has been called, all user code is run under one of the program's active object's Run() or RunError() functions.

Implements [PVActiveBase](#).

The TCP Socket class

7.230.2 Constructor & Destructor Documentation

7.230.2.1 OSCL_IMPORT_REF OsclTCPSocket::~OsclTCPSocket ()

Destructor. The object must be deleted using the same allocator used in the NewL call.

7.230.3 Member Function Documentation

7.230.3.1 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::Accept (int32 aTimeout = -1)

Accept incoming connections. This is an asynchronous method.

Parameters:

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.2 OSCL_IMPORT_REF int32 OsclTCPSocket::Bind (OsclNetworkAddress & aAddress)

Bind a TCP socket to an address. This is a synchronous method.

Parameters:

aAddress: Bind address.

Returns:

Returns OsclErrNone for success, or a platform-specific error code.

7.230.3.3 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::BindAsync (OsclNetworkAddress & aAddress, int32 aTimeoutMsec = (-1))

Bind a TCP socket to an address. This is an asynchronous method.

Parameters:

aAddress: Bind address.

aTimeoutMsec: Optional timeout. Use a negative value for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.4 OSCL_IMPORT_REF void OsclTCPSocket::CancelAccept ()

Cancel Accept

This method will cancel any pending Accept operation on the current socket, causing the Accept to complete with error EPVSocketCancel. If there is no pending Accept operation, this method will have no effect.

7.230.3.5 OSCL_IMPORT_REF void OsclTCPSocket::CancelBind ()

Cancel Bind

This method will cancel any pending BindAsync operation on the current socket, causing the BindAsync to complete with error EPVSocketCancel. If there is no pending BindAsync operation, this method will have no effect.

7.230.3.6 OSCL_IMPORT_REF void OsclTCPSocket::CancelConnect ()

Cancel Connect

This method will cancel any pending Connect operation on the current socket, causing the Connect to complete with error EPVSocketCancel. If there is no pending Connect operation, this method will have no effect.

7.230.3.7 OSCL_IMPORT_REF void OsclTCPSocket::CancelListen ()

Cancel Async Listen

This method will cancel any pending ListenAsync operation on the current socket, causing the Listen to complete with error EPVSocketCancel. If there is no pending Listen operation, this method will have no effect.

7.230.3.8 OSCL_IMPORT_REF void OsclTCPSocket::CancelRecv ()

Cancel Recv

This method will cancel any pending Recv operation on the current socket, causing the Recv to complete with error EPVSocketCancel. If there is no pending Recv operation, this method will have no effect.

7.230.3.9 OSCL_IMPORT_REF void OsclTCPSocket::CancelSend ()

Cancel Send

This method will cancel any pending Send operation on the current socket, causing the Send to complete with error EPVSocketCancel. If there is no pending Send operation, this method will have no effect.

7.230.3.10 OSCL_IMPORT_REF void OsclTCPSocket::CancelShutdown ()

Cancel Shutdown

This method will cancel any pending Shutdown operation on the current socket, causing the Shutdown to complete with error EPVSocketCancel. If there is no pending Shutdown operation, this method will have no effect.

7.230.3.11 OSCL_IMPORT_REF int32 OsclTCPSocket::Close ()

Close a TCP socket. This is a synchronous method.

Once it is closed a socket cannot be re-opened. Sockets are automatically closed when they are deleted. This method may be used to see any error code returned from the platform's socket close call.

Returns:

Returns OsclErrNone for success, or a platform-specific error code.

7.230.3.12 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::Connect (OsclNetworkAddress & aAddress, int32 aTimeoutMsec = -1)

Connect to an address. This is an asynchronous method.

Parameters:

aAddress: a network address.

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.13 OSCL_IMPORT_REF OsclTCPSocket* OsclTCPSocket::GetAcceptedSocketL (uint32 aId)

Retrieve the accept socket after a successful Accept operation. This is a synchronous method.

Parameters:

aId: Socket ID. The caller must assign an ID to each socket. The ID is used to identify the socket in observer callbacks.

Returns:

Returns pointer to socket, or NULL if error. Note: The caller is responsible for deleting any accepted socket that it retrieves.

7.230.3.14 OSCL_IMPORT_REF int32 OsclTCPSocket::GetPeerName (OsclNetworkAddress & aPeerName)

Retrieves the peer address of the socket

Parameters:

aPeerName: This will store the peer address when API returns successfully.

Returns:

Returns OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.230.3.15 OSCL_IMPORT_REF uint8* OsclTCPSocket::GetRecvData (int32 * aLength)

Retrieve the received data after a successful Recv operation. This is a synchronous method.

Parameters:

aLength: (output) number of bytes of data received.

Returns:

Returns pointer to received data, or NULL if none.

7.230.3.16 OSCL_IMPORT_REF uint8* OsclTCPSocket::GetSendData (int32 * aLength)

Retrieve the sent data after a successful Send operation. This is a synchronous method.

Parameters:

aLength: (output) number of bytes of data sent.

Returns:

Returns pointer to sent data, or NULL if none.

7.230.3.17 OSCL_IMPORT_REF int32 OsclTCPSocket::Listen (int32 aQueueSize)

Listen. This is a synchronous method.

Parameters:

aQueueSize: Queue size.

Returns:

Returns OsclErrNone for success, or a platform-specific error code.

7.230.3.18 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::ListenAsync (int32 aQueueSize, int32 aTimeoutMsec = (-1))

ListenAsync This is an asynchronous method.

Parameters:

aQueueSize: Queue size.

aTimeoutMsec: Optional timeout. Use a negative value for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.19 OSCL_IMPORT_REF OsclTCPSocket* OsclTCPSocket::NewL (Oscl_DefAlloc & alloc, OsclSocketServ & aServ, OsclSocketObserver * aObserver, uint32 aId) [static]

Create a TCP Socket. May leave if failure.

Parameters:

alloc: Memory allocator.

aServ: Socket server. Must be connected.

aObserver: Socket observer.

aId: Socket ID. The caller must assign an ID to each socket. The ID is used to identify the socket in observer callbacks.

Returns:

Returns pointer to socket.

7.230.3.20 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::Recv (uint8 * aPtr, uint32 aMaxLen, int32 aTimeoutMsec = -1)

Receive Data. This is an asynchronous method.

Parameters:

aPtr: Buffer for received data.

aMaxLen: Length of buffer.

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.21 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::Send (const uint8 * aPtr, uint32 aLen, int32 aTimeoutMsec = -1)

Send Data. This is an asynchronous method.

Parameters:

aPtr: Data to send.

aLen: Length of data to send.

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.22 OSCL_IMPORT_REF int32 OsclTCPSocket::SetOptionToReuseAddress ()

Allows the server to bind to an address which is in a TIME_WAIT state.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.230.3.23 OSCL_IMPORT_REF int32 OsclTCPSocket::SetTOS (const OsclSocketTOS & aTOS)

Sets the Type of Service field of each outgoing IP datagram.

Parameters:

aTOS: Specifies the type of service requested.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

**7.230.3.24 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::Shutdown
(TPVSocketShutdown aHow, int32 aTimeoutMsec = -1)**

Shutdown a socket. This is an asynchronous method.

Parameters:

aHow: type of shutdown

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.230.3.25 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::ThreadLogoff ()

Thread logoff routine. This will prepare for transfer and use of the socket in another thread. All socket requests must be complete prior to calling this routine. If any requests are still active, it will return EPVSocketFailure;

**7.230.3.26 OSCL_IMPORT_REF TPVSocketEvent OsclTCPSocket::ThreadLogon
(OsclSocketServ & aServ, OsclSocketObserver * aObserver)**

Thread logon routine. This will complete the transfer of a socket from another thread for use in the current thread. The ThreadLogoff API must be called in the original thread prior to calling ThreadLogon.

7.232.1 Detailed Description

Thread Class. A subset of Thread APIs. It implements platform independent APIs for thread creation, exiting, suspend, resume, priority and termination. With the use of proper defines it implements the basic thread features. It provides an opaque layer through which user doesn't need to worry about OS specific data.

7.232.3 Member Function Documentation

7.232.3.1 OSCL_IMPORT_REF TOsclThreadTerminate OsclThread::CanTerminate ()

Tell if thread terminate will do join, immediate hard kill, or NOP.

Returns:

Terminate behavior.

**7.232.3.2 OSCL_IMPORT_REF bool OsclThread::CompareId ([TOsclThreadId & t1](#),
[TOsclThreadId & t2](#)) [static]**

Static routine to compare whether two thread ID's are equal.

Parameters:

t1, t2: thread ID passed by the application

Returns:

true if equal.

**7.232.3.3 OSCL_IMPORT_REF [OsclProcStatus::eOsclProcError](#) OsclThread::Create
([TOsclThreadFuncPtr func](#), [int32 stack_size](#), [TOsclThreadFuncArg argument](#),
[OsclThread_State state = Start_on_creation](#), [bool oIsJoinable = false](#))**

This routine will create a thread. The thread may be launched immediately or may be created in a suspended state and launched with a Resume call.

Parameters:

func = Name of the thread Function *stack_size* = Size of the thread stack. If zero, then the platform-specific default stack size will be used. *argument* = Argument to be passed to thread function *state* = Enumeration which specifies the state of the thread on creation with values Running and Suspend. Note: the Suspend option may not be available on all platforms. If it is not supported, the Create call will return INVALID_PARAM_ERROR. *oIsJoinable* = A boolean, which when set to true, creates a Joinable thread. The default value for this is false, which creates a Detached thread. Note 1: When a joinable thread is created, it is imperative to call thread Terminate. Otherwise, it would cause a memory leak. Note 2: This is currently available only for platforms that have support for pthreads.

Returns:

[eOsclProcError](#)

7.232.3.4 OSCL_IMPORT_REF void OsclThread::Exit ([OsclAny * exitcode](#)) [static]

Exit is a static function which is used to end the current thread. When called it just ends the execution of the current thread. Note: on some platforms this may be a NOP.

Parameters:

exitcode = Exitcode of the thread. This can be used by other threads to know the exit status of this thread.

Returns:

None

**7.232.3.5 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::GetId
(TOsclThreadId & refThreadId) [static]**

Static routine to retrieve ID of calling thread.

Parameters:

Thread ID passed by the application

Returns:

Error code

**7.232.3.6 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::GetPriority
(OsclThreadPriority & refThreadPriority)**

GetThreadPriority gets the priority of the thread. It takes reference of the input argument and assigns priority to it from one of the already defined priorities.

Parameters:

int16& refThreadPriority : Output Priority value

Returns:

Error code

7.232.3.7 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::Resume ()

ResumeThread resumes the suspended thread and brings it into execution.

Parameters:

None

Returns:

Error code Note: this function may not be supported on all platforms, and may return NOT_ - IMPLEMENTED.

**7.232.3.8 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::SetPriority
(OsclThreadPriority ePriority)**

SetThreadPriority sets the priority of the thread. It takes priority as the input argument and assigns it to the thread referred.

Parameters:

ePriorityLevel : Input Priority value

Returns:

Error code Note: this function may not be supported on all platforms, and may return NOT_ - IMPLEMENTED.

7.232.3.9 OSCL_IMPORT_REF void OsclThread::SleepMillisec (const int32 msec) [static]

Suspend current thread execution for specified time.

Parameters:

msec, *t2*: sleep time in milliseconds.

7.232.3.10 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::Suspend ()

This API suspends the thread being referred. The thread can later be brought into execution by calling OSCL_ResumeThread() on it.

Parameters:

None

Returns:

Error code Note: this function may not be supported on all platforms, and may return NOT_IMPLEMENTED.

**7.232.3.11 OSCL_IMPORT_REF OsclProcStatus::eOsclProcError OsclThread::Terminate
(OsclAny * *exitcode*)**

Terminate a thread other than the calling thread.

This API may have multiple behaviors. It may do a hard kill, a "join" operation, or a do-nothing. Caller can use CanTerminate option to tell the behavior in advance.

Parameters:

exitcode = Exitcode of the thread.

Returns:

Error code

Request a timer

Parameters:

timerID used to identify the timer for cancellation. This value will be returned as part of the timeout event.

timeoutInfo for user info. Returned to the observer on a timeout event

cycles the number of cycles to wait before a timeout event. If the timer frequency is 1 and the cycles are set to 2, then the timeout event will occur in 2 seconds.

obs a local observer object to be called on a timeout event. This observer overrides the global observer if set.

7.235.3.4 template<class Alloc> void OsclTimer< Alloc >::SetExactFrequency (uint32 *frequency*)

Set the exact frequency of the timer in microsecond.

Parameters:

7.237.2 Constructor & Destructor Documentation

7.237.2.1 OSCL_IMPORT_REF OsclTimerObject::OsclTimerObject (int32 *aPriority*, const char *name*[])

Constructor.

Parameters:

aPriority (input param): scheduling priority

name (input param): optional name for this AO.

7.237.2.2 virtual OSCL_IMPORT_REF OsclTimerObject::~OsclTimerObject () [virtual]

Destructor.

7.237.3 Member Function Documentation

7.237.3.1 OSCL_IMPORT_REF void OsclTimerObject::AddToScheduler ()

Add this AO to the current thread's scheduler.

Reimplemented from [PVActiveBase](#).

7.237.3.2 OSCL_IMPORT_REF void OsclTimerObject::After (int32 *aDelayMicrosec*)

'After' sets the request ready, with request status OSCL_REQUEST_STATUS_PENDING, and starts a timer. When the timer expires, the request will complete with status OSCL_REQUEST_ERR_NONE. Must be called from the same thread in which the active object is scheduled. Will leave if the request is already readied, the object is not added to any scheduler, or the calling thread does not match the scheduling thread.

Parameters:

anInterval: timeout interval in microseconds.

7.237.3.3 OSCL_IMPORT_REF void OsclTimerObject::Cancel ()

Cancel any active request. If the request is pending, this will call the DoCancel routine, wait for the request to cancel, then set the request idle. The AO will not run. If the request is not active, it does nothing. Request must be canceled from the same thread in which it is scheduled.

Reimplemented from [PVActiveBase](#).

7.237.3.4 virtual OSCL_IMPORT_REF void OsclTimerObject::DoCancel () [protected, virtual]

Cancel request handler. This gets called by scheduler when the request is cancelled. The default routine will cancel the timer. If any additional action is needed, the derived class may override this. If the derived class does override this, it should explicitly call [OsclTimerObject::DoCancel](#) in its own DoCancel routine.

Implements [PVActiveBase](#).

7.237.3.5 OSCL_IMPORT_REF bool OsclTimerObject::IsBusy ()

Return true if this AO is active, false otherwise.

7.237.3.6 OSCL_IMPORT_REF int32 OsclTimerObject::Priority ()

Return scheduling priority of this exec object.

7.237.3.7 OSCL_IMPORT_REF void OsclTimerObject::RemoveFromScheduler ()

Remove this AO from its scheduler. Will leave if the calling thread context does not match the scheduling thread. Cancels any pending request before removing.

Reimplemented from [PVActiveBase](#).

7.237.3.8 virtual OSCL_IMPORT_REF int32 OsclTimerObject::RunError (int32 *aError*) [protected, virtual]

Run Leave handler. This gets called by scheduler when the Run routine leaves. The default implementation simply returns the leave code. If the derived class wants to handle errors from Run, it may override this. The ExecError should return OsclErrNone if it handles the error, otherwise it should return the input error code.

Parameters:

aError: the leave code generated by the Run.

Implements [PVActiveBase](#).

7.237.3.9 OSCL_IMPORT_REF void OsclTimerObject::RunIfNotReady (uint32 *aDelayMicrosec* = 0)

Complete the request after a time interval. RunIfNotReady is identical to [After\(\)](#) except that it first checks the request status, and if it is already readied, it does nothing.

Parameters:

aDelayMicrosec (input param): delay in microseconds.

7.237.3.10 OSCL_IMPORT_REF void OsclTimerObject::SetBusy ()

Set request ready for this AO. Will leave if the request is already readied, or the exec object is not added to any scheduler, or the calling thread context does not match the scheduler thread.

7.237.3.11 OSCL_IMPORT_REF void OsclTimerObject::SetStatus (int32)

7.237.3.12 OSCL_IMPORT_REF int32 OsclTimerObject::Status ()

7.247.1 Detailed Description

The UDP Socket class

7.247.2 Constructor & Destructor Documentation

7.247.2.1 OSCL_IMPORT_REF OsclUDPSocket::~OsclUDPSocket ()

Destructor. The object must be deleted using the same allocator used in the NewL call.

7.247.3 Member Function Documentation

7.247.3.1 OSCL_IMPORT_REF int32 OsclUDPSocket::Bind ([OsclNetworkAddress](#) & *aAddress*)

Bind a UDP socket to an address. This is a synchronous method.

Parameters:

aAddress: Bind address.

Returns:

Returns OsclErrNone for success, or a platform-specific error code.

7.247.3.2 OSCL_IMPORT_REF [TPVSocketEvent](#) OsclUDPSocket::BindAsync ([OsclNetworkAddress](#) & *aAddress*, int32 *aTimeoutMsec* = (-1))

Bind a UDP socket to an address. This is an asynchronous method.

Parameters:

aAddress: Bind address.

aTimeoutMsec: Optional timeout. Use a negative value for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.247.3.3 OSCL_IMPORT_REF void OsclUDPSocket::CancelBind ()

Cancel Bind

This method will cancel any pending BindAsync operation on the current socket, causing the BindAsync to complete with error EPVSocketCancel. If there is no pending BindAsync operation, this method will have no effect.

7.247.3.4 OSCL_IMPORT_REF void OsclUDPSocket::CancelRecvFrom ()

Cancel RecvFrom

This method will cancel any pending RecvFrom operation on the current socket, causing the RecvFrom to complete with error EPVSocketCancel. If there is no pending RecvFrom operation, this method will have no effect.

7.247.3.5 OSCL_IMPORT_REF void OsclUDPSocket::CancelSendTo ()

Cancel SendTo

This method will cancel any pending SendTo operation on the current socket, causing the SendTo to complete with error EPVSocketCancel. If there is no pending SendTo operation, this method will have no effect.

7.247.3.6 OSCL_IMPORT_REF int32 OsclUDPSocket::Close ()

Close a UDP socket. This is a synchronous method.

Once it is closed a socket cannot be re-opened. Sockets are automatically closed when they are deleted. This method may be used to see any error code returned from the platform's socket close call.

Returns:

Returns OsclErrNone for success, or a platform-specific error code.

7.247.3.7 OSCL_IMPORT_REF int32 OsclUDPSocket::GetPeerName ([OsclNetworkAddress](#) & *aPeerName*)

Retrieves the peer address of the socket

Parameters:

aPeerName: This will store the peer address when API returns successfully.

Returns:

Returns OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.247.3.8 OSCL_IMPORT_REF uint8* OsclUDPSocket::GetRecvData (int32 * *aLength*)

Retrieve the received data after a successful RecvFrom operation. This is a synchronous method.

Parameters:

aLength: (output) number of bytes of data received.

Returns:

Returns pointer to received data, or NULL if none.

7.247.3.9 OSCL_IMPORT_REF uint8* OsclUDPSocket::GetSendData (int32 * *aLength*)

Retrieve the sent data after a successful SendTo operation. This is a synchronous method.

Parameters:

aLength: (output) number of bytes of data sent.

Returns:

Returns pointer to sent data, or NULL if none.

7.247.3.10 OSCL_IMPORT_REF int32 OsclUDPSocket::Join ([OsclNetworkAddress](#) & *aAddress*)

Bind a UDP socket to an address and Join the multicast group. This is a synchronous method.

Parameters:

aAddress: Bind address.

Returns:

Returns OsclErrNone for success, or a platform-specific error code. May throw an OsclErrNotSupported Exception

7.247.3.11 OSCL_IMPORT_REF int32 OsclUDPSocket::JoinMulticastGroup ([OsclIpMReq](#) & *aMReq*)

Join the multicast group.

Parameters:

aMReq: Multicast group information.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.247.3.12 OSCL_IMPORT_REF OsclUDPSocket* OsclUDPSocket::NewL ([Oscl_DefAlloc](#) & *alloc*, [OsclSocketServ](#) & *aServ*, [OsclSocketObserver](#) * *aObserver*, uint32 *aId*) [static]

Create a UDP Socket. May leave if failure.

Parameters:

alloc: Memory allocator.

aServ: Socket server. Must be connected.

aObserver: Socket observer.

aId: Socket ID. The caller must assign an ID to each socket. The ID is used to identify the socket in observer callbacks.

Returns:

Returns pointer to socket.

7.247.3.13 OSCL_IMPORT_REF TPVSocketEvent OsclUDPSocket::RecvFrom (uint8 * *aPtr*, uint32 *aMaxLen*, [OsclNetworkAddress](#) & *aAddress*, int32 *aTimeoutMsec* = -1, uint32 *aMultiRecvLimit* = 0, [Oscl_Vector](#)< uint32, [OsclMemAllocator](#) > * *aPacketLen* = NULL, [Oscl_Vector](#)< [OsclNetworkAddress](#), [OsclMemAllocator](#) > * *aPacketSource* = NULL)

Receive Data. This is an asynchronous method.

Parameters:

aPtr: Buffer to receive incoming data

aMaxLen: Length of buffer.

aAddress: (output) Source address.

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

aMultiRecvLimit (optional input): Configures multiple packet receive mode. As long as there are packets queued at the socket and at least aMultiRecvLimit bytes are available in the buffer, recvfrom operations will continue. A value of zero disabled multiple packet mode. The individual packet lengths can be retrieved in the aPacketLen parameter; and the individual packet source addresses can be retrieved in the aPacketSource parameter.

aPacketLen: (optional output) a vector of packet lengths, in case multiple packets were received.

aPacketSource: (optional output) a vector of source addresses, in case multiple packets were received.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.247.3.14 OSCL_IMPORT_REF TPVSocketEvent OsclUDPSocket::SendTo (const uint8 * aPtr, uint32 aLen, OscINetworkAddress & aAddress, int32 aTimeoutMsec = -1)

Send Data. This is an asynchronous method.

Parameters:

aPtr: Data to send.

aLen: Length of data to send.

aAddress: Destination address.

aTimeoutMsec: Timeout in milliseconds, or (-1) for infinite wait.

Returns:

Will return EPVSocketPending if successful. When the operation is complete, a callback to the observer will occur with the completion status. If the operation cannot be initiated, the call will return EPVSocketFailure and there will be no callback.

7.247.3.15 OSCL_IMPORT_REF int32 OsclUDPSocket::SetMulticastTTL (int32 aTTL)

Controls the number of intermediate systems through which a multicast datagram can be forwarded.

Parameters:

aTTL:Specifies the time-to-live value for multicast datagrams sent through this socket.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.247.3.16 OSCL_IMPORT_REF int32 OsclUDPSocket::SetOptionToReuseAddress ()

Allows the server to bind to an address which is in a TIME_WAIT state.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.247.3.17 OSCL_IMPORT_REF int32 OsclUDPSocket::SetRecvBufferSize (uint32 *size*)

Set the buffer size of the socket This is a synchronous method.

Parameters:

size: buffer size

Returns:

Returns OsclErrNone for success, or a platform-specific error code. May throw an OsclErrNotSupported Exception.

7.247.3.18 OSCL_IMPORT_REF int32 OsclUDPSocket::SetTOS (const OsclSocketTOS & *aTOS*)

Sets the Type of Service field of each outgoing IP datagram.

Parameters:

aTOS: Specifies the type of service requested.

Returns:

Returns: OsclErrNone for success, or a platform-specific error code. or PVSOCK_ERR_NOT_SUPPORTED, if underlying OS doesn't support joining multicast group PVSOCK_ERR_BAD_PARAM, if config io file is not configured in accordance with underlying OS PVSOCK_ERR_NOT_IMPLEMENTED, if this API is not implemented in OSCL for the underlying OS

7.247.3.19 OSCL_IMPORT_REF TPVSocketEvent OsclUDPSocket::ThreadLogoff ()

Thread logoff routine. This will prepare for transfer and use of the socket in another thread. All socket requests must be complete prior to calling this routine. If any requests are still active, it will return EPVSocketFailure;

**7.247.3.20 OSCL_IMPORT_REF TPVSocketEvent OsclUDPSocket::ThreadLogon
(OsclSocketServ & *aServ*, OsclSocketObserver * *aObserver*)**

Thread logon routine. This will complete the transfer of a socket from another thread for use in the current thread. The ThreadLogoff API must be called in the original thread prior to calling ThreadLogon.

7.250.1 Detailed Description

PV Scheduler internal AO base class. Both [OsclActiveObject](#) and [OsclTimerObject](#) derive from this class. For Symbian, this just container has the desired additions to the basic CTimer or OsclActiveObj functionality. For non-Symbian, this class contains the entire AO implementation.

7.250.2.1 PVActiveBase::PVActiveBase (const char *name*[], int32 *pri*)

7.250.2.2 virtual PVActiveBase::~PVActiveBase () [virtual]

7.250.3 Member Function Documentation

7.250.3.1 void PVActiveBase::Activate ()

7.250.3.2 void PVActiveBase::AddToScheduler ()

Reimplemented in [OsclActiveObject](#), and [OsclTimerObject](#).

7.250.3.3 void PVActiveBase::Cancel ()

Reimplemented in [OsclActiveObject](#), and [OsclTimerObject](#).

7.250.3.4 void PVActiveBase::Destroy ()

7.250.3.5 virtual void PVActiveBase::DoCancel () [pure virtual]

Implements cancellation of an outstanding request.

This function is called as part of the active object's [Cancel\(\)](#).

It must call the appropriate cancel function offered by the active object's asynchronous service provider. The asynchronous service provider's cancel is expected to act immediately.

[DoCancel\(\)](#) must not wait for event completion; this is handled by [Cancel\(\)](#).

Implemented in [OsclDNSRequestAO](#), [OsclSocketRequestAO](#), [OsclActiveObject](#), and [OsclTimerObject](#).

7.250.3.6 OSCL_IMPORT_REF bool PVActiveBase::IsAdded ()

7.250.3.7 bool PVActiveBase::IsInAnyQ () [inline]

7.250.3.8 void PVActiveBase::RemoveFromScheduler ()

Reimplemented in [OsclActiveObject](#), and [OsclTimerObject](#).

7.250.3.9 virtual void PVActiveBase::Run () [pure virtual]

Handles an active object's request completion event.

A derived class must provide an implementation to handle the completed request. If appropriate, it may issue another request.

The function is called by the active scheduler when a request completion event occurs, i.e. after the active scheduler's `WaitForAnyRequest()` function completes.

Before calling this active object's `Run()` function, the active scheduler has:

1. decided that this is the highest priority active object with a completed request
2. marked this active object's request as complete (i.e. the request is no longer outstanding)

`Run()` runs under a trap harness in the active scheduler. If it leaves, then the active scheduler calls `ExecError()` to handle the leave.

Note that once the active scheduler's `Start()` function has been called, all user code is run under one of the program's active object's `Run()` or `RunError()` functions.

Implemented in [OsclDNSMethod](#), [OsclDNSRequestAO](#), [OsclSocketMethod](#), [OsclSocketRequestAO](#), and [CallbackTimer< Alloc >](#).

7.250.3.10 virtual int32 PVActiveBase::RunError (int32 *aError*) [pure virtual]

Virtual routine that gets called if the active object's Run routine leaves.

Parameters:

***aError*:** the leave code generated by the Run.

Returns:

:returns `OsclErrNone` if the error was handled, or returns the input *aError* value if not handled.

Implemented in [OsclActiveObject](#), and [OsclTimerObject](#).

7.250.5.5 TReadyQueLink PVActiveBase::iPVReadyQLink

7.250.5.6 OsclAOStatus PVActiveBase::iStatus

The request status associated with an asynchronous request.

This is passed as a parameter to all asynchronous service providers.

The active scheduler uses this to check whether the active object's request has completed.

The function can use the completion code to judge the success or otherwise of the request.

Request status contains one of the values OSCL_REQUEST_ERR_NONE: request completed with no error, or request is not active. OSCL_REQUEST_PENDING: request is active & pending OSCL_REQUEST_ERR_CANCEL: request was canceled before completion. or any user-defined value.

Logger Constructor

Parameters:

tag Logger tag, unique to a logging control point

level Active Log level of the logger

oAppenderInheritance

Returns:

NONE

7.252.2.2 `virtual PVLogger::~PVLogger () [inline, virtual]`

7.252.3 Member Function Documentation

7.252.3.1 `void PVLogger::AddAppender (OsclSharedPtr< PVLoggerAppender > & appender) [inline]`

This method adds an appender to the logging control point. Each logger maintains a list of appenders. Any msg to a logger if deemed active is logged to all the appenders.

Parameters:

appender pointer to the appender to add

Returns:

NONE

Exceptions:

leaves if out of memory

7.252.3.2 `void PVLogger::AddFilter (OsclSharedPtr< PVLoggerFilter > & filter) [inline]`

This method adds a message filter to the logging control point. Each logger maintains a list of filters. Any msg to a logger if deemed active is passed through the msg filters prior to logging.

Parameters:

msgFilter pointer to the filter to add

Returns:

NONE

Exceptions:

leaves if out of memory

7.252.3.3 OSCL_IMPORT_REF void PVLogger::Cleanup () [static]

Frees the PVLogger singleton used by the current thread. This must be called before thread exit. No messages can be logged after cleanup.

Returns:**7.252.3.4 void PVLogger::DisableAppenderInheritance () [inline]**

This method disables appender inheritance for the logging control point

7.252.3.5 OSCL_IMPORT_REF PVLogger* PVLogger::GetLoggerObject (const char * *inputTag*) [static]

This is a factory method to create a log control point, with a certain input tag. There is a central registry of all the loggers, with their corresponding tags, called PV Logger Registry. In case the logger with the specified tag exists in the global registry, it is returned, else a new one is created and a pointer to the same is returned.

Parameters:

inputTag logger tag, viz. "x.y.z"

level log level associated with the logging control point (All messages with log levels less than equal to the log level of the control point would be logged)

oAppenderInheritance

Returns:

PVLogger* Pointer to the logging control point

Exceptions:

leaves if out of memory

7.252.3.6 log_level_type PVLogger::GetLogLevel () [inline]

This method returns the log level of a control point. This could either have been set explicitly by the user (at the time of creation or later) or could have been inherited from one of its ancestors.

Returns:

log level associated with the logging control point

7.252.3.7 uint32 PVLogger::GetNumAppenders () [inline]

This method returns the number of appenders attached to the logging control point.

7.252.3.8 PVLogger* PVLogger::GetParent () [inline, protected]**7.252.3.9 OSCL_IMPORT_REF void PVLogger::Init () [static]**

PVLogger needs to be initialized once per thread. This creates the PVLogger singleton that is used throughout the duration of the thread. Initialization must occur before the first message is logged.

Exceptions:

leaves if out of memory

7.252.3.10 OSCL_IMPORT_REF bool PVLogger::IsActive ([log_level_type level](#))

This method determines if a msg passed to the logging control point is active or not. Only messages that are deemed active are logged. Messages are considered not active if any of the following criteria are met:

- All logging is disabled at this logging control point
- If all the log levels, leading upto the root log point are uninitialized
- If the log level of the incoming message is LESS THAN that of the active log level of the logging control point.

Returns:

BOOL

7.252.3.11 OSCL_IMPORT_REF void PVLogger::LogMsgBuffers ([message_id_type msgID](#), int32 *numPairs*, ...)

This method logs opaque data buffers to all the appenders, after running through the message filters. After logging the message to the appenders attached to the current control point, the message is passed up to the parent node, only if appender inheritance is enabled.

Parameters:

msgID Message ID, that is unique to a message

numPairs Number of (ptr_len, ptr) pairs

arguments Variable list of arguments

Returns:

NONE

7.252.3.12 OSCL_IMPORT_REF void PVLogger::LogMsgBuffersV ([message_id_type msgID](#), int32 *numPairs*, va_list *arguments*)

This method logs opaque data buffers to all the appenders, after running through the message filters. After logging the message to the appenders attached to the current control point, the message is passed up to the parent node, only if appender inheritance is enabled.

Parameters:

msgID Message ID, that is unique to a message

numPairs Number of (ptr_len, ptr) pairs

arguments Variable list of arguments

Returns:

NONE

7.252.3.13 OSCL_IMPORT_REF void PVLogger::LogMsgString (*message_id_type msgID, const char *fmt, ...)*

This method logs formatted text msg to all the appenders, after running through the message filters. After logging the message to the appenders attached to the current control point, the message is passed up to the parent node, only if appender inheritance is enabled.

Parameters:

msgID Message ID, that is unique to a message

fmt format string, similar to one taken by printf

arguments Variable list of arguments

Returns:

NONE

7.252.3.14 OSCL_IMPORT_REF void PVLogger::LogMsgStringV (*message_id_type msgID, const char *fmt, va_list arguments)*

This method logs formatted text msg to all the appenders, after running through the message filters. After logging the message to the appenders attached to the current control point, the message is passed up to the parent node, only if appender inheritance is enabled.

Parameters:

msgID Message ID, that is unique to a message

fmt format string, similar to one taken by printf

arguments Variable list of arguments

Returns:

NONE

7.252.3.15 void PVLogger::RemoveAppender (*OsclSharedPtr< PVLoggerAppender > & appender*) [inline]

This method removes an appender from the logging control point. Each logger maintains a list of appenders. Any msg to a logger if deemed active is logged to all the appenders.

Parameters:

appender pointer to the appender to delete

Returns:

NONE

7.252.3.16 void PVLogger::SetLogLevel (*log_level_type* *level*) [inline]

This method is used to set the log level of a control point.

Parameters:

level log level associated with the logging control point

Returns:

NONE

7.252.3.17 OSCL_IMPORT_REF void PVLogger::SetLogLevelAndPropagate (*log_level_type* *level*)

This method is used to set the log level of a control point, as well as to propagate the level to all the descendants of this control point.

Parameters:

level log level associated with the logging control point

Returns:

NONE

7.256.1 Detailed Description

Class: PVLoggerRegistry

PVLoggerRegistry class, maintains a repository of all the loggers, along with their associated tags, in a tag tree. Any request for a log control point is serviced by this class.

Memory Ownership: Creates log control points for each tag, and holds these pointers in the tag tree. `PVLogger` registry is responsible for calling the destructor on each of these loggers.

7.256.4 Member Function Documentation

7.256.4.1 OSCL_IMPORT_REF PVLogger* PVLoggerRegistry::CreatePVLogger (const char * *tagIn*, log_level_type *level*, bool *oAppenderInheritance*)

This method creates a log control point, with specified tag, and level

Parameters:

inputTag logger tag, viz. "x.y.z"
level log level associated with the logging control point
oAppenderInheritance

Returns:

PVLogger<alloc_type, TheLock>* Pointer to the logging control point

7.256.4.2 OSCL_IMPORT_REF PVLogger* PVLoggerRegistry::GetPVLoggerObject (const char * *tagIn*)

PVLoggerRegistry method to get access to a logging control point, associated with a tag. In case the logger for this tag does not exist, it is created afresh, else pointer to the existing one is returned.

Parameters:

inputTag logger tag, viz. "x.y.z"
level log level associated with the logging control point
oAppenderInheritance

Returns:

PVLogger<Alloc, TheLock>* Pointer to the logging control point

7.256.4.3 OSCL_IMPORT_REF PVLoggerRegistry* PVLoggerRegistry::GetPVLoggerRegistry () [static]

Get the logger registry. There is only one logger registry instance per thread.

7.256.4.4 OSCL_IMPORT_REF void PVLoggerRegistry::SetNodeLogLevelExplicit (Oscl_TagTree< PVLogger *, alloc_type >::node_type * *node*, log_level_type *level*)

This method recursively propagates the log level to all the descendants, of a node.

Parameters:

node Node ptr, associated with a logger, from the tag tree.
level log level associated with the logging control point

Returns:

NONE

**7.256.4.5 OSCL_IMPORT_REF bool PVLoggerRegistry::SetNodeLogLevelExplicit (char * *tagIn*,
log_level_type level)**

This method propagates the log level to all the descendants of the node, with a specified tag.

Parameters:

tagIn logger tag, viz. "x.y.z"

level log level associated with the logging control point

Returns:

true on success, else false.

7.269.1 Detailed Description

The TimeValue class represents a time value in a format native to the system.

This class provides common time functions independent of any OS. The actual representation used is native to the system that the class is compiled on to increase efficiency. Macros used in this class:

- OSCL_HAS_ANSI_STRING_SUPPORT:

Definitions to determine the type of basic time structure used to store the time

- OSCL_HAS_UNIX_TIME_FUNCS
- OSCL_HAS_SYMBIAN_SUPPORT
- OSCL_HAS_MSWIN_SUPPORT

7.269.2 Constructor & Destructor Documentation

7.269.2.1 OSCL_COND_IMPORT_REF TimeValue::TimeValue ()

Create a TimeValue representing the current time.

7.269.2.2 OSCL_COND_IMPORT_REF TimeValue::TimeValue (const TimeValue & *Tv*)

Copy constructor.

7.269.2.3 OSCL_COND_IMPORT_REF TimeValue::TimeValue (long *tv*, TimeUnits *units*)

Create a TimeValue representing an interval of tv units.

Parameters:

- tv* The number of units in the interval to be represented by this TimeValue.
- units* The units of the tv argument. Must be in the enumeration TimeUnits.

7.269.2.4 OSCL_COND_IMPORT_REF TimeValue::TimeValue (const OsclBasicTimeStruct & *in_tv*)

Create a TimeValue representing the absolute time specified by the BasicTimeStruct.

Parameters:

- in_tv* OsclBasicTimeStruct as defined for each platform.

7.269.2.5 OSCL_COND_IMPORT_REF TimeValue::TimeValue (const ISO8601timeStrBuf *time_strbuf*)

7.269.2.6 OSCL_COND_IMPORT_REF TimeValue::TimeValue (uint16 *aYear*, uint16 *aMonth*, uint16 *aDay*, uint16 *aHour*, uint16 *aMinute*, uint16 *aSecond*, uint16 *aMilliseconds*)

TimeValue constructor that sets time according to following input parameter for a specific date time. Please note that no argument is check for its validity (range etc) It might assert incase wrong argument are passed by user of this api.

Parameters:

in] uint16 wYear;
in] uint16 wMonth; Jan = 1 to Dec = 12
in] uint16 wDay; 1-28/29/30/31
in] uint16 wHour; 0 to 23
in] uint16 wMinute; 0 to 59
in] uint16 wSecond; 0 to 59
in] uint16 wMilliseconds; 0 to 999

7.269.2.7 OSCL_COND_IMPORT_REF TimeValue::TimeValue ([OsclBasicDateTimeStruct in_ts](#))

Create a TimeValue representing the absolute time specified by the BasicDateTimeStruct.

Parameters:

in_ts OsclBasicDateTimeStruct as defined for each platform provides the date in a readable format (i.e. day, date, week etc.) Notes: Implementation incomplete (= not done) on Win32, Wince, Symbian

7.269.3 Member Function Documentation**7.269.3.1 OSCL_IMPORT_REF int TimeValue::get_ISO8601_str_time ([ISO8601timeStrBuf time_strbuf](#))**

Get a PV extended text representation of the Time based on the ISO 8601 format.

Parameters:

time_strbuf A ISO8601timeStrBuf object to which the text representation will be written,

Returns:

The number of characters copied to the buffer, not including the terminating null. The returned string is of the form "1985-04-12 10:15:30Z".

7.269.3.2 OSCL_COND_IMPORT_REF int32 TimeValue::get_local_time ()

Get the local time after having adjusted for daylight saving.

Notes: Implementation incomplete (= not done) on Win32, Wince, Symbian

7.269.3.3 OSCL_IMPORT_REF int TimeValue::get_pv8601_str_time ([PV8601timeStrBuf time_strbuf](#))

Get a PV extended text representation of the Time based on the PV 8601 format.

Parameters:

time_strbuf A PV8601timeStrBuf object to which the text representation will be written,

Returns:

The number of characters copied to the buffer, not including the terminating null. The returned string is of the form "19850412T101530.047Z".

7.269.3.4 OSCL_IMPORT_REF char* TimeValue::get_rfc822_gmtime_str (int max_time_strlen, char * time_str)

Get a text representation of the time in the GMT timezone based on the RFC 822 / RFC 1123 (also described in the HTTP spec RFC 2068 and RFC 2616).

Parameters:

max_time_strlen The maximum number of characters that can be written to the buffer.

time_str A pointer to the buffer to which the characters will be written.

Returns:

Returns a pointer to the buffer (same as *time_str*) containing a null terminated (c-style) string of the form "Wed, 30 Jun 1993 21:49:08 GMT".

7.269.3.5 OSCL_COND_IMPORT_REF uint32 TimeValue::get_sec ()

Get a 32 bit value representing the seconds since the (system dependent) epoch.

Returns:

This call returns a 32 bit value representing the number of seconds since the epoch. On unix systems this represents the number of seconds since the unix epoch Jan 1 1970. On Win32 this represents the number of seconds since Jan 1, 1601. This is intended to be used for intervals rather than for absolute time. (On Win32 for example, a 32 bit value would be too small to represent the number of seconds from the epoch until the current time.)

7.269.3.6 OSCL_IMPORT_REF char* TimeValue::get_str_ctime (CtimeStrBuf ctime_strbuf)

Get a string containing a text representation of this TimeValue object.

Parameters:

ctime_strbuf A CtimeStrBuf object to which the text representation will be written,

Returns:

A pointer to the input CtimeStrBuf is returned. This string is null terminated of the form "Wed Jun 30 21:49:08 1993".

7.269.3.7 OSCL_COND_IMPORT_REF OsclBasicTimeStruct* TimeValue::get_timeval_ptr ()**7.269.3.8 OSCL_COND_IMPORT_REF uint64 TimeValue::get_timevalue_in_usec ()**

Get a 64 bit value representing the time value converted to microseconds.

Returns:

Returns a uint64 value representing the time value in terms of microseconds. The time origin is dependent on platform for which OSCL is compiled. For example for symbian it is midnight, January 1st, 0 AD for windows it is January 1, 1601 (UTC)

7.269.3.9 OSCL_COND_IMPORT_REF uint32 TimeValue::get_usec ()

Get a 32 bit value representing the number of microseconds in the time value.

Returns:

Returns a uint32 value representing the number of microseconds in the time value after subtracting off the whole seconds.

7.269.3.10 OSCL_COND_IMPORT_REF bool TimeValue::is_zero ()

Determine if the time value is zero.

7.269.3.11 OSCL_COND_IMPORT_REF bool TimeValue::is_zulu ()

Manipulate internal flags to mark the time value as being in "zulu" (GMT) time.

7.269.3.12 OSCL_COND_IMPORT_REF TimeValue& TimeValue::operator *= (const int scale)

This operator scales the time value by a constant.

8.2 oscl_assert.h File Reference

The file [oscl_assert.h](#) provides an OSCL_ASSERT macro to document assumptions and test them during development.

```
#include "oscl_base.h"  
#include "oscl_assert.inl"
```

Defines

- #define **OSCL_ASSERT**(_expr) ((_expr)?((void)0):OSCL_Assert(# _expr,__FILE__,__LINE__))

Functions

- OSCL_COND_IMPORT_REF void **_OSCL_Abort** ()
This function terminates the current process abnormally.
- OSCL_IMPORT_REF void **OSCL_Assert** (const char *expr, const char *filename, int line_number)
OSCL_ASSERT macro evaluates an expression and when the result is false, prints a diagnostic message and aborts the program.

8.2.1 Detailed Description

The file [oscl_assert.h](#) provides an OSCL_ASSERT macro to document assumptions and test them during development.

8.3 oscl_base.h File Reference

8.5 oscl_base_macros.h File Reference

This file defines common macros and constants for basic compilation support.

```
#include "osclconfig.h"
```

Defines

- #define **NULL_TERM_CHAR** '\0'
The NULL_TERM_CHAR is used to terminate c-style strings.
- #define **NULL** (0)
if the NULL macro isn't already defined, then define it as zero.
- #define **OSCL_INLINE** inline
- #define **OSCL_COND_EXPORT_REF**
- #define **OSCL_COND_IMPORT_REF**
- #define **OSCL_CONST_CAST**(type, exp) ((type)(exp))

- #define **OSCL_PACKED_VAR** "error"

8.5.1 Detailed Description

This file defines common macros and constants for basic compilation support.

8.6 oscl_bin_stream.h File Reference

Defines a set of binary stream classes which handle portable input / output of binary data regardless of the native byte order.

```
#include "oscl_base.h"
#include "oscl_bin_stream.inl"
```

Data Structures

- class [OsclBinIStream](#)
- class [OsclBinIStreamBigEndian](#)
- class [OsclBinIStreamLittleEndian](#)
- class [OsclBinOStream](#)

Class OsclBinOStream implements the basic stream functions for an output stream.

- class [OsclBinOStreamBigEndian](#)

Class OsclBinOStreamBigEndian implements a binary output stream using big endian byte ordering.

- class [OsclBinOStreamLittleEndian](#)

Class OsclBinOStreamLittleEndian implements a binary output stream using little endian byte ordering.

- class [OsclBinStream](#)

8.6.1 Detailed Description

Defines a set of binary stream classes which handle portable input / output of binary data regardless of the native byte order.

8.7 oscl_byte_order.h File Reference

This file defines functions providing byte ordering utility (e.g., switching between big and little endian orders).

```
#include "oscl_base.h"  
#include "oscl_byte_order.inl"
```

Functions

- void [little_endian_to_host](#) (char *data, uint32 size)
Convert little endian to host format.
- void [host_to_little_endian](#) (char *data, unsigned int size)
Convert host to little endian format.
- void [big_endian_to_host](#) (char *data, unsigned int size)
Convert big endian to host format.
- void [host_to_big_endian](#) (char *data, unsigned int size)
Convert host to big endian format.

8.7.1 Detailed Description

This file defines functions providing byte ordering utility (e.g., switching between big and little endian orders).

8.8 oscl_defalloc.h File Reference

The file defines simple default memory allocator classes. These allocators are used by the [Oscl_Vector](#) and [Oscl_Map](#) class, etc.

```
#include "oscl_base.h"  
#include "osclconfig_compiler_warnings.h"  
#include "oscl_mem_inst.h"

8.8.1 Detailed Description

The file defines simple default memory allocator classes. These allocators are used by the [Oscl_Vector](#) and [Oscl_Map](#) class, etc.

8.9 oscl_dll.h File Reference

Defines a DLL entry point.

```
#include "osclconfig.h"
```

Defines

- #define **OSCL_DLL_ENTRY_POINT()** void oscl_dll_entry_point() {}
- #define **OSCL_DLL_ENTRY_POINT_DEFAULT()**

8.9.1 Detailed Description

Defines a DLL entry point.

8.10 oscl_dns.h File Reference

The file [oscl_socket.h](#) defines the OSCL DNS APIs.

```

Functions

- OSCL_IMPORT_REF bool [OSCL_IsErrnoSupported \(\)](#)
This function determines if a particular system saves the error number that occurs on a system call.
- OSCL_IMPORT_REF int [OSCL_GetLastError \(\)](#)
This function returns the value of the system's global error number variable.
- OSCL_IMPORT_REF bool [OSCL_SetLastError \(int newVal\)](#)
This function sets the last error code for the system.
- OSCL_IMPORT_REF char * [OSCL_StrError \(int errnum\)](#)
This function maps an error number to an error-message string.

8.20.1 Detailed Description

Defines functions to access additional information on errors where supported through an errno or similar service.

Data Structures

- class **OsclException**

oscl_exception.h contains all the exception handling macros and classes This template class provides the base exception class that all exceptions derive from

Defines

- #define **OSCL_LEAVE(_leave_status)** OsclError::Leave(_leave_status)
Use this macro to cause a Leave. It terminates the execution of the current active function.
- #define **OSCL_TRY(_leave_status, _statements)** _PV_TRAP(_leave_status,_statements)
This macro will be used to set up a try block.
- #define **OSCL_TRY_NO_TLS(_trapimp, _leave_status, _statements)** _PV_TRAP_NO_TLS(_-
 $_trapimp, _leave_status, _statements)$
• #define **OSCL_FIRST_CATCH_ANY(_leave_status, _statements)** if (_leave_status!=OsclErrNone){ _statements; }
This section defines the macros to be used in the catch block following the try block Use this macro to call a function that handles all exception types thrown in the preceding try block.
- #define **OSCL_FIRST_CATCH(_leave_status, _catch_value, _statements)** if (_leave_status!=OsclErrNone && _leave_status == _catch_value){_statements;}
Use this macro to define a block of code that catches the first exception type thrown in the preceding try block.
- #define **OSCL_CATCH(_leave_status, _catch_value, _statements)** else if (_leave_status!=OsclErrNone && _leave_status == _catch_value){_statements;}
Use this macro to define a block of code for catching additional exception types.
- #define **OSCL_CATCH_ANY(_leave_status, _statements)** else if (_leave_status!=OsclErrNone){ _-
 $_statements;$
Use this macro to call a function that will catch all remaining exception types.
- #define **OSCL_LAST_CATCH(_leave_status)** else if (_leave_status!=OsclErrNone){OSCL_-
 $LEAVE(_leave_status);$
Use this macro if OSCL_CATCH_ANY has not been used. It will mark the end of the catch block.

8.29.1 Detailed Description

8.30 oscl_exclusive_ptr.h File Reference

This file defines the [OsclExclusivePtr](#) template class. This class is used to avoid any potential memory leaks that may arise while returning from methods in case of error.

```
#include "oscl_defalloc.h"
```

Data Structures

- class [OsclExclusiveArrayPtr](#)

The OsclExclusiveArrayPtr class is a template class that defines an array pointer like object intended to be assigned an address obtained (directly or or indirectly) by new. When the OsclExclusiveArrayPtr expires, its destructor uses delete to free the memory.

- class [OsclExclusivePtr](#)

The OsclExclusivePtr class is a template class that defines a pointer like object intended to be assigned an address obtained (directly or or indirectly) by new. When the OsclExclusivePtr expires, its destructor uses delete to free the memory.

- class [OsclExclusivePtrA](#)

The OsclExclusivePtrA class is a template class that defines any pointer like object intended to be assigned an address obtained (directly or or indirectly) through Alloc. When the OsclExclusivePtrA expires, Alloc is used to free the memory.

8.47 oscl_lock_base.h File Reference

This file defines an abstract lock class, [OsclLockBase](#), that is used for APIs potentially requiring multi-thread safety. A null-lock implementation, [OsclNullLock](#), is also provided for single-thread configurations (basically a noop for lock/unlock). Also provides the [OsclScopedLock](#) class which is template class takes care of freeing the lock when the class goes out of scope.

Data Structures

- class [OsclLockBase](#)
- class [OsclNullLock](#)
- class [OsclScopedLock](#)

The OsclScopedLock class is a template class that handles unlocking an abstract class on destruction. This is very useful for ensuring that the lock is released when the OsclScopedLock goes out of scope.

8.47.1 Detailed Description

This file defines an abstract lock class, [OsclLockBase](#), that is used for APIs potentially requiring multi-thread safety. A null-lock implementation, [OsclNullLock](#), is also provided for single-thread configurations (basically a noop for lock/unlock). 8.52.1 Detailed Description

This file contains basic memory definitions for common use across platforms.

This is the main entry point header file for the OSCL memory library. It should be the only one users directly include. Basic memory copy, compare, and move functions are defined here as well as the allocation functions.

8.52.2 Define Documentation

8.52.2.1 #define OSCL_DISABLE_WARNING_TRUNCATE_DEBUG_MESSAGE

Previously this was in oscl_mem_imp.h

8.52.3 Function Documentation

8.52.3.1 void operator delete (void * *aPtr*) [inline]

8.52.3.2 void* operator new (size_t *aSize*) [inline]

8.53 oscl_mem_align.h File Reference

8.54 oscl_mem_audit.h File Reference

Data Structures

- class [OsclMutex](#)
- class [OsclThreadLock](#)

Typedefs

- typedef [OsclMutex OsclNoYieldMutex](#)

8.60.1 Detailed Description

This file provides implementation of mutex.

8.60.2 Typedef Documentation

8.60.2.1 typedef [OsclMutex OsclNoYieldMutex](#)

Class [OsclNoYieldMutex](#) can be used in use cases where there will be no CPU-yielding operation done while the Mutex is locked.

CPU-yielding operations include [OsclMutex::Lock](#), [OsclSemaphore::Wait](#), [OsclThread::Sleep](#), and [OsclBrewThreadUtil::BThreadYield](#).

The behavior of [OsclNoYieldMutex](#) depends on whether the threading model is pre-emptive or not. When threading is pre-emptive, it is identical to [OsclMutex](#). When threading is non-pre-emptive, it is a NO-OP.

An example of this type of use case is for simple data protection.

- #define PV_SOCKET_SERVI_STATS 0

8.107.1 Define Documentation

8.107.1.1 #define PV_OSCL_SOCKET_1MB_RECV_BUF 0

Set this to 0 or 1 to enable/disable setting the socket receive buffer size to 1 MB in the Bind call. This setting only affects PV socket server implementations.

When set to 1, the code will use the OsclSetRecvBufferSize macro to set the buffer size in the Bind call.

This setting was found to improve streaming performance on WinMobile devices, but should not generally be used.

8.107.1.2 #define PV_OSCL_SOCKET_SERVER_LOGGER_OUTPUT 0

Set this to 0 or 1 to enable/disable [PVLogger](#) output from PV socket server. Note that socket server logging will appear in a different file when running threaded mode of socket server. This is quite a bit of logging, so it should generally be disabled.

8.107.1.3 #define PV_OSCL_SOCKET_STATS_LOGGING 0

Set this to 0 or 1 to enable/disable socket stats logging with "OsclSocketStats" node. This feature is fairly costly so should be off in production code.

8.107.1.4 #define PV_SOCKET_REQUEST_AO_PRIORITY OsclActiveObject::EPriority-Nominal

PV_SOCKET_REQUEST_AO_PRIORITY sets the priority of the socket request completion AOs.

8.107.1.5 #define PV_SOCKET_SERVER 1

Enable/disable the PV socket server here.

8.107.1.6 #define PV_SOCKET_SERVER_AO_INTERVAL_MSEC 5

PV_SOCKET_SERVER_AO_INTERVAL_MSEC sets the AO scheduling interval of the PV socket server AO for non-threaded implementations.

8.107.1.7 #define PV_SOCKET_SERVER_AO_PRIORITY (OsclActiveObject::EPriority-Nominal)

PV_SOCKET_SERVER_AO_PRIORITY sets priority of the PV socket server AO for non-threaded implementations.

8.107.1.8 #define PV_SOCKET_SERVER_IS_THREAD OSCL_HAS_THREAD_SUPPORT

PV_SOCKET_SERVER_IS_THREAD chooses either the threaded or AO-based implementation of the PV socket server

8.107.1.9 #define PV_SOCKET_SERVER_SELECT 0

PV_SOCKET_SERVER_SELECT chooses whether to use "select" call or not. In threaded mode, select call is required and is forced to "1". In AO mode, "select" call is an option that defaults to "0". Avoiding any "select" call was found to greatly reduce CPU usage on WinMobile devices.

8.107.1.10 #define PV_SOCKET_SERVER_SELECT_LOOPBACK_SOCKET 0

PV_SOCKET_SERVER_SELECT_LOOPBACK_SOCKET enables the feature to wakeup the select call by writing to a loopback socket each time a new request comes in. This option is required to support the blocking select option of threaded server mode. This option is forced to "0" in AO mode.

8.107.1.11 #define PV_SOCKET_SERVER_SELECT_TIMEOUT_MSEC (-1)

PV_SOCKET_SERVER_SELECT_TIMEOUT_MSEC sets duration of the select call in the PV socket server thread for the polling select loop implementation. When the timeout is -1, the select call will block forever waiting on a new request and will use a loopback socket to signal a new request. Note: if infinite wait is selected, but loopback socket is not available, the implementation will poll at 10 msec intervals.

8.107.1.12 #define PV_SOCKET_SERVER_THREAD_PRIORITY ThreadPriorityAboveNormal

PV_SOCKET_SERVER_THREAD_PRIORITY sets the priority of the PV socket server thread.

8.107.1.13 #define PV_SOCKET_SERVI_STATS 0

For detailed performance breakdown of time spend in [OsclSocketServI](#) AO. Output is logged under "OsclSchedulerPerfStats" node. Should be off in production code. This option is forced to "0" in threaded mode.

Utilities to parse and convert strings.

8.117 oscl_string_xml.h File Reference

Utilities to escape special characters in XML strings.

```
#include "oscl_base.h"
```

Functions

- OSCL_IMPORT_REF bool [oscl_str_need_escape_xml](#) (const char *str_buf, uint32 &num_escape_bytes, uint32 max_bytes=0)

Check if the input string contains any special ASCII character like &, <, >, ', ". The function scans the string and check if each character is a special character. It stops at the first NULL character (if max_bytes = 0), or the max_byte value.

- OSCL_IMPORT_REF int32 [oscl_str_escape_xml](#) (const char *str_buf_in, char *str_buf_out, uint32 max_out_buf_bytes, uint32 max_bytes=0, uint32 *num_bytes_written=NULL)

Escape any of the following special characters in the string Special ASCII characters: &, <, >, ', ".

8.122 oscl_time.h File Reference

The file `oscl_time.h` defines two classes `NTPTime` and `TimeValue` for getting, manipulating, and formatting time values. The `TimeValue` class is based on the native system time format while `NTPTime` is used for the standard Network Time Protocol format.

```
#include "oscl_base.h"
#include "osclconfig_time.h"
#include "oscl_int64_utils.h"
#include "oscl_time.inl"
```

Data Structures

- class `NTPTime`

The NTPTime class represents a time value as the number of seconds since 0h (UTC) Jan. 1, 1900.

- class `TimeValue`

The TimeValue class represents a time value in a format native to the system.

Typedefs

- typedef char `CtimeStrBuf` [`CTIME_BUFFER_SIZE`]
- typedef char `PV8601timeStrBuf` [`PV8601TIME_BUFFER_SIZE`]
- typedef char `ISO8601timeStrBuf` [`ISO8601TIME_BUFFER_SIZE`]

Enumerations

- enum `TimeUnits` { `SECONDS` = 0, `MILLISECONDS` = 1, `MICROSECONDS` = 2 }

The TimeUnits enum can be used when constructing a `TimeValue` class.

Functions

- OSCL_IMPORT_REF void `PV8601ToRFC822` (`PV8601timeStrBuf` `pv8601_buffer`, `CtimeStrBuf` `ctime_buffer`)
- OSCL_IMPORT_REF void `ISO8601ToRFC822` (`ISO8601timeStrBuf` `iso8601_buffer`, `CtimeStrBuf` `ctime_buffer`)

Data Structures

- struct [OsclMemoryFragment](#)

Typedefs

- [typedef int c_bool](#)
The c_bool type is mapped to an integer to provide a bool type for C interfaces.
- [typedef void OsclAny](#)
The OsclAny is meant to be used the context of a generic pointer (i.e., no specific type).
- [typedef char mbchar](#)
mbchar is multi-byte char (e.g., UTF-8) with null termination.
- [typedef unsigned int uint](#)
The uint type is a convenient abbreviation for unsigned int.

- `typedef TOsclConditionObject __verify__TOsclConditionObject_defined__`

8.149.1 Typedef Documentation

8.149.1.1 `typedef TOsclConditionObject __verify__TOsclConditionObject_defined__`

type TOsclConditionObject should be defined as the type used as a condition variable on the target platform.
Example: `typedef pthread_cond_t TOsclConditionObject;`

Note: Condition variables are only used with certain semaphore implementations. If the semaphore implementation does not require a condition variable, then this type can be defined as 'int' as follows: `typedef int TOsclConditionObject; //not used`

8.149.1.2 `typedef TOsclMutexObject __verify__TOsclMutexObject_defined__`

type TOsclMutexObject should be defined as the type used as a mutex object or handle on the target platform. Example: `typedef pthread_mutex_t TOsclMutexObject;`

8.149.1.3 `typedef TOsclSemaphoreObject __verify__TOsclSemaphoreObject_defined__`

type TOsclSemaphoreObject should be defined as the type used as a mutex object or handle on the target platform. Example: `typedef sem_t TOsclSemaphoreObject;`

8.149.1.4 `typedef TOsclThreadFuncArg __verify__TOsclThreadFuncArg_defined__`

type TOsclThreadFuncArg should be defined as the type used as a thread function argument on the target platform. Example: `typedef LPVOID TOsclThreadFuncArg;`

8.149.1.5 `typedef TOsclThreadFuncRet __verify__TOsclThreadFuncRet_defined__`

type TOsclThreadFuncRet should be defined as the type used as a thread function return value on the target platform. Example: `typedef DWORD TOsclThreadFuncRet;`

8.149.1.6 `typedef TOsclThreadId __verify__TOsclThreadId_defined__`

type TOsclThreadId should be defined as the type used as a thread ID on the target platform. Example: `typedef DWORD TOsclThreadId;`

8.149.1.7 `typedef TOsclThreadObject __verify__TOsclThreadObject_defined__`

type `TOsclThreadObject` should be defined as the type used as a thread object or handle on the target platform. Example: `typedef pthread_t TOsclThreadObject;`

8.158.1 Detailed Description

This file contains basic logger interfaces for common use across platforms.

This is the main entry point header file for the logger library. It should be the only one users directly include.

8.158.2 Define Documentation

8.158.2.1 #define _PVLOGGER_LOGBIN(LOGGER, LEVEL, MESSAGE)

Value:

```
{\
  if (LOGGER) \
  {\
    if (LOGGER->IsActive(LEVEL)) \
    {\
      LOGGER->LogMsgBuffers MESSAGE; \
    }\
  }\
}
```

8.158.2.2 #define _PVLOGGER_LOGBIN_V(LOGGER, LEVEL, MESSAGE)

Value:

```
{\
  if (LOGGER) \
  {\
    if (LOGGER->IsActive(LEVEL)) \
    {\
      LOGGER->LogMsgBuffersV MESSAGE; \
    }\
  }\
}
```

8.158.2.3 #define _PVLOGGER_LOGMSG(LOGGER, LEVEL, MESSAGE)

Value:

```
{\
  if (LOGGER) \
  {\
    if (LOGGER->IsActive(LEVEL)) \
    {\
      LOGGER->LogMsgString MESSAGE; \
    }\
  }\
}
```

8.158.2.4 #define _PVLOGGER_LOGMSG_V(LOGGER, LEVEL, MESSAGE)

Value:

```
{\
  if (LOGGER) \
  {\
    if (LOGGER->IsActive(LEVEL)) \
    {\
      LOGGER->LogMsgStringV MESSAGE; \
    }\
  }\
}
```

8.158.2.5 #define PVLOGGER_ENABLE 1

In case logging is compiled out, there is no need to compile the logger runtime code either.

8.158.2.6 #define PVLOGGER_INST_LEVEL 5**8.158.2.7 #define PVLOGGER_INST_LEVEL_SUPPORT 1****8.158.2.8 #define PVLOGGER_LOG_USE_ONLY(x) x**

Used to compile in/out lines of code that are used only for **PVLogger** macros.

This code will be removed at compile time when **PVLogger** is disabled, i.e. Release mode. So do not put in any code that is necessary for correct functionality of the module

**8.158.2.9 #define PVLOGGER_LOGBIN(IL, LOGGER, LEVEL, MESSAGE)
PVLOGGER_LOGBIN_ ## IL (LOGGER, LEVEL, MESSAGE)**

This is a binary API to log messages

Parameters:

IL Instrumentation level.

LOGGER Pointer to the logger object, that acts as the logging control/interface point

LEVEL Log level of the message

MESSAGE Log Message which includes the message id, and message buffers that need to be logged.

Example Usage: PVLOGGER_LOGBIN (PVLOGMSG_INST_LLDBG, logger_1, PVLOGMSG_WARNING, (10, 3, msgBuf1Size, msgBuf1, msgBuf2Size, msgBuf2, msgBuf3Size, msgBuf3));

-This message contains THREE (ptr_len, ptr) pairs. Log level of this msg is PVLOGMSG_WARNING, message id is 10.

High Level Debug Layer

This layer should contain messages that have very minimal impact on performance, but are at lower level (i.e., provide more information) than would be appropriate in a shipping product. The messages are probably used to gather information and validate proper functionality at a high level as might be appropriate for IOT, stress testing, or QA testing.

8.158.2.34 #define PVLOGMSG_INST_LLDBG 4

Low Level Debug Layer

This layer should contain messages for early functional testing. The messages are typically at a very low-level and allow testing the functionality of individual modules and components. Messages at this layer will typically have a performance impact (sometimes significant) due to the fact that they are at such a low level.

8.158.2.35 #define PVLOGMSG_INST_MLDBG 3

Mid Level Debug Layer

This layer should contain messages that are useful in the middle stages of the development cycle where major components are being integrated. The components themselves should already be well-tested so the emphasis is on interfaces between these components and integration testing. Messages at this layer may have some performance impact.

8.158.2.36 #define PVLOGMSG_INST_PROF 1

Profile Layer

The profile layer is used for messages and information related to measuring and reporting performance-related information.

8.158.2.37 #define PVLOGMSG_INST_REL 0

Release Layer

The release layer should only be used for messages that should remain in the final release. In certain cases all messaging may be disabled depending on customer requirements. However, when allowed the release layer should contain information that will be useful diagnosing problems in a released product (perhaps after entering a diagnostic mode), but with absolutely minimal performance impact when disabled at runtime.

8.160.1 Detailed Description

This file contains basic logger interfaces for common use across platforms. C-callable version.

This is the main entry point header file for the logger library. It should be the only one users directly include.

8.160.2 Define Documentation

- 8.160.2.1 `#define PVLOGGER_C_INST_LEVEL 5`
- 8.160.2.2 `#define PVLOGMSG_C_ALERT 1`
